Note All of the <model> elements inside a <modelSequence> element must be processed. The operations indicated by each <model> child cannot be dependent on any other operation in the sequence. The results must be rendered in the order given by the list of <model>s in the <modelSequence>.

Example

```
<modelGrp output="print">
  <modelSequence>
    <model behaviour="inline">
      <param name="content" value="@n"/>
    </model>
    <model behaviour="footnote">
      <param name="place" value="'foot'"/>
    </model>
  </modelSequence>
</modelGrp>
```

Schematron <sch:rule context="tei:modelSequence"> <sch:report test="tei:model[@output]" role="warning">The <model> children of a <modelSequence> element inherit the @output attribute of the parent <modelSequence>, and thus should not have their own.</sch:report> </sch:rule>

Content model

```
<content>
 <sequence>
  <alternate minOccurs="0"
   maxOccurs="unbounded">
   <classRef key="model.identEquiv"/>
   <classRef key="model.descLike"/>
  </alternate>
  <elementRef key="model" minOccurs="2"
   maxOccurs="unbounded"/>
 </sequence>
</content>
```

Schema Declaration

```
element modelSequence
{
   att.global.attributes,
   att.global.analytic.attributes,
   att.global.change.attributes,
   att.global.facs.attributes,
   att.global.linking.attributes,
   att.global.rendition.attributes,
   att.global.responsibility.attributes,
   att.global.source.attributes,
   attribute predicate { text }?,
   attribute useSourceRendition { text }?,
   attribute output { "web" | "print" | "plaintext" }?,
   ( ( model.identEquiv | model.descLike )*, ( model, model, model* ) )
}
```

<moduleRef> (module reference) references a module which is to be incorporated into a schema. [*23.2. Modules and Schemas*]

  - att.global.source
    - *@source*

`@prefix` specifies a default prefix which will be prepended to all patterns from the imported module.

Status Optional

Datatype 0–1 occurrences of teidata.xmlName separated by whitespace

Schematron <sch:rule context="tei:moduleRef"> <sch:report test="//*[not(generate-id(.) eq generate-id(current()))]/@prefix = @prefix"> The @prefix attribute of «sch:name/» should not match that of any other element (it would defeat the purpose).</sch:report> </sch:rule>

Schematron <sch:rule context="tei:moduleRef"> <sch:report test="@except and @include">It is an error to supply both the @include and @except attributes.</sch:report> </sch:rule>

Note Use of this attribute avoids name collisions (and thus invalid schemas) when the external schema being mixed in with TEI uses a name the TEI or some other included external schema already uses for a pattern.

`@include` supplies a list of the elements which are to be copied from the specified module into the schema being defined.
Status Optional
Datatype 0–∞ occurrences of teidata.xmlName separated by whitespace

`@except` supplies a list of the elements which are not to be copied from the specified module into the schema being defined.
Status Optional
Datatype 0–∞ occurrences of teidata.xmlName separated by whitespace

`@key` the name of a TEI module
Status Optional
Datatype teidata.xmlName

`@url` (uniform resource locator) refers to a non-TEI module of RELAX NG code by external location
Status Optional
Datatype teidata.pointer

Member of model.oddRef
Contained by
tagdocs: schemaSpec specGrp
May contain
tagdocs: content

Note If neither *include* nor *except* is supplied, the effect of this element is to make all the declarations contained by the referenced module available to the schema being compiled. If both attributes are supplied, an ODD processor should signal an error.

A TEI module is identified by the name supplied as value for the *ident* attribute on a <moduleSpec> element. The *source* attribute may be used to specify an online source from which the specification of that module may be read. A URI may alternatively be supplied in the case of a non-TEI module, and this is expected to be written as a RELAX NG schema.

If the *url* attribute is used, the <content> element may also be supplied as a child of this element. Its content (which is assumed to be a fragment of RELAX NG code) will be copied along with the content of the resource indicated by the *url* attribute into the target RELAX NG schema.

Example

```
<moduleRef  key="linking"/>
```

This includes all objects available from the linking module.

Example

```
<moduleRef  key="linking"
  except="linkGrp link"/>
```

This includes all elements available from the linking module except for the <link> and <linkGrp> elements.

Example

```
<moduleRef  key="linking"
  include="linkGrp link"/>
```

This includes only the <link> and <linkGrp> elements from the linking module.

Schematron <sch:rule context="tei:moduleRef"> <sch:report test="* and @key"> Child elements of «sch:name/» are only allowed when an external module is being loaded. </sch:report> </sch:rule>

Content model

```
<content>
 <elementRef key="content" minOccurs="0"/>
</content>
```

Schema Declaration

```
element moduleRef
{
   att.global.attributes,
   att.global.analytic.attributes,
   att.global.change.attributes,
   att.global.facs.attributes,
   att.global.linking.attributes,
   att.global.rendition.attributes,
   att.global.responsibility.attributes,
   att.global.source.attributes,
   attribute prefix { ? }?,
   ( attribute include { list { * } }? | attribute except { list { * } }? ),
   ( attribute key { text }? | attribute url { text }? ),
   content?
}
```

<moduleSpec> (module specification) documents the structure, content, and purpose of a single module, i.e. a named and externally visible group of declarations. [*23.2. Modules and Schemas*]

Contained by biblStruct

May contain

core: author biblScope editor imprint meeting note noteGrp ptr ref respStmt textLang title

header: authority availability edition extent funder idno sponsor

tagdocs: listRef

Note May contain specialized bibliographic elements, in a prescribed order.

The <monogr> element may only occur only within a <biblStruct>, where its use is mandatory for the description of a monographic-level bibliographic item.

Example

```
<biblStruct>
  <analytic>
    <author>Chesnutt, David</author>
    <title>Historical Editions in the States</title>
  </analytic>
  <monogr>
    <title level="j">Computers and the Humanities</title>
    <imprint>
      <date when="1991-12">(December, 1991):</date>
    </imprint>
    <biblScope>25.6</biblScope>
    <biblScope unit="page" from="377" to="380">377–380</biblScope>
  </monogr>
</biblStruct>
```

Example

```
<biblStruct type="book">
  <monogr>
    <author>
      <persName>
        <forename>Leo Joachim</forename>
        <surname>Frachtenberg</surname>
      </persName>
    </author>
    <title type="main" level="m">Lower Umpqua Texts</title>
    <imprint>
      <pubPlace>New York</pubPlace>
      <publisher>Columbia University Press</publisher>
      <date>1914</date>
    </imprint>
  </monogr>
  <series>
    <title type="main" level="s">Columbia University Contributions to
        Anthropology</title>
    <biblScope unit="volume">4</biblScope>
  </series>
</biblStruct>

- att.performed
  - *@perf*
- att.typed
  - ~~type~~
  - @subtype

`@type` characterizes the movement, for example as an entrance or exit.

Derived from att.typed

Status Optional

Datatype teidata.enumerated

Suggested values include: **entrance** character is entering the stage.

exit character is exiting the stage.

onStage character moves on stage

`@where` specifies the direction of a stage movement.

Status Optional

Datatype 1–∞ occurrences of teidata.authority separated by whitespace

Sample values include: **L** (left) stage left

R (right) stage right

C (center) centre stage

Note Full blocking information will normally require combinations of values, (for example 'UL' for 'upper stage left') and may also require more detailed encoding of speed, direction etc. Full documentation of any coding system used should be provided in the header. URIs may be used as values.

Note Although the <msDesc> has primarily been designed with a view to encoding manuscript descriptions, it may also be used for other objects such as early printed books, fascicles, epigraphs, or any text-bearing objects that require substantial description. If an object is not text-bearing or the reasons for describing the object is not primarily the textual content, the more general <object> may be more suitable.

Example

```
<msDesc>
  <msIdentifier>
    <settlement>Oxford</settlement>
    <repository>Bodleian Library</repository>
    <idno  type="Bod">MS Poet. Rawl. D. 169.</idno>
  </msIdentifier>
  <msContents>
    <msItem>
      <author>Geoffrey Chaucer</author>
      <title>The Canterbury Tales</title>
    </msItem>
  </msContents>
  <physDesc>
    <objectDesc>
      <p>A parchment codex of 136 folios, measuring approx
            28 by 19 inches, and containing 24 quires.</p>
      <p>The pages are margined and ruled throughout.</p>
      <p>Four hands have been identified in the manuscript: the first 44
            folios being written in two cursive anglicana scripts, while the
            remainder is for the most part in a mixed secretary hand.</p>
    </objectDesc>
  </physDesc>
</msDesc>
```

Schematron <sch:rule context="tei:msContents|tei:physDesc|tei:history|tei:additional"> <sch:let name="gi" value="name(.)"/> <sch:report test="preceding-sibling::*[name(.) eq $gi] and not(following-sibling::*[name(.) eq $gi])"> Only one «sch:name/» is allowed as a child of «sch:value-of select="name(..)"/». </sch:report> </sch:rule>

Content model

```

msdescription: additional history msContents msIdentifier msPart physDesc

Note As this last example shows, for compatibility reasons the identifier of a manuscript part may be supplied as a simple <altIdentifier> rather than using the more structured <msIdentifier> element. This usage is however deprecated.

Example

```
<msPart>
  <msIdentifier>
    <idno>A</idno>
    <altIdentifier type="catalog">
      <collection>Becker</collection>
      <idno>48, Nr. 145</idno>
    </altIdentifier>
    <altIdentifier type="catalog">
      <collection>Wiener Liste</collection>
      <idno>4°5</idno>
    </altIdentifier>
  </msIdentifier>
  <head>
    <title xml:lang="la">Gregorius: Homiliae in Ezechielem</title>
    <origPlace key="tgn_7008085">Weissenburg (?)</origPlace>
    <origDate notBefore="0801"
      notAfter="0815">IX. Jh., Anfang</origDate>
  </head>
</msPart>
```

Example

```
<msDesc>
  <msIdentifier>
    <settlement>Amiens</settlement>
    <repository>Bibliothèque Municipale</repository>
    <idno>MS 3</idno>
    <msName>Maurdramnus Bible</msName>
  </msIdentifier>
  <msContents>
    <summary>
```

```
        <list>
          <item  xml:lang="en">Miscellany of various texts;</item>
          <item  xml:lang="la">Prudentius, Psychomachia;</item>
          <item  xml:lang="la">Physiologus de natura animantium</item>
        </list>
      </summary>

  * *@source*

- att.typed
  - ~~type~~
  - @subtype

`@type` provides a type for a node.

Derived from att.typed

Status Optional

Datatype teidata.enumerated

Suggested values include: **initial** initial node in a transition network

final final node in a transition network

```
<graph>
  <node  xml:id="gnex11"
    adjTo="#gnex12"
    adj="#gnex13"
    type="initial">
    <label>1</label>
  </node>
  <node  xml:id="gnex12"
    adjFrom="#gnex11"
    adjTo="#gnex13">
    <label>2</label>
  </node>
  <node  xml:id="gnex13"
    adjFrom="#gnex12"
    adj="#gnex11"
    type="final">
    <label>3</label>
  </node>
</graph>
```

`@value` provides the value of a node, which is a feature structure or other analytic element.

Status Optional

Datatype teidata.pointer

`@adjTo` (adjacent to) gives the identifiers of the nodes which are adjacent to the current node.

Status Optional

Datatype 1–∞ occurrences of teidata.pointer separated by whitespace

```
<graph>
  <node  xml:id="gnex21"
    adjTo="#gnex22"
    adj="#gnex23"
    type="initial">
    <label>1</label>
```

```
  </node>
  <node  xml:id="gnex22"
    adjTo="#gnex23">
    <label>2</label>
  </node>
  <node  xml:id="gnex23"
    type="final">
    <label>3</label>
  </node>
</graph>
```

`@adjFrom` (adjacent from) gives the identifiers of the nodes which are adjacent from the current node.

Status Optional

Datatype 1–∞ occurrences of teidata.pointer separated by whitespace

```
<graph>
  <node  xml:id="gnex31"
    type="initial">
    <label>1</label>
  </node>
  <node  xml:id="gnex32"
    adjFrom="#gnex31">
    <label>2</label>
  </node>
  <node  xml:id="gnex33"
    adjFrom="#gnex32"
    adj="#gnex31"
    type="final">
    <label>3</label>
  </node>
</graph>
```

`@adj` (adjacent) gives the identifiers of the nodes which are both adjacent to and adjacent from the current node.

Status Optional

Datatype 1–∞ occurrences of teidata.pointer separated by whitespace

```
<graph>
  <node  xml:id="gnex41"
    adj="#gnex42 #gnex43"
    type="initial">
    <label>1</label>
  </node>
  <node  xml:id="gnex42"
    adj="#gnex41 #gnex43">
    <label>2</label>
  </node>
  <node  xml:id="gnex43"
    adj="#gnex42 #gnex41"
    type="final">
    <label>3</label>
  </node>
</graph>
```

Note Use this attribute instead of the *adjTo* and *adjFrom* attributes when the graph is undirected and vice versa if the graph is directed.

`@inDegree` gives the in degree of the node, the number of nodes which are adjacent from the given node.

Status Optional

Datatype teidata.count

```
<graph>
  <node  xml:id="gnex51"
    adjTo="#gnex52"
    adj="#gnex53"
    inDegree="1"
    type="initial">
    <label>1</label>
  </node>
  <node  xml:id="gnex52"
    adjFrom="#gnex51"
    adjTo="#gnex53"
    inDegree="2">
    <label>2</label>
  </node>
  <node  xml:id="gnex53"
    adjFrom="#gnex52"
    adj="#gnex51"
    inDegree="2"
    type="final">
    <label>3</label>
  </node>
</graph>
```

`@outDegree` gives the out degree of the node, the number of nodes which are adjacent to the given node.

Status Optional

Datatype teidata.count

```
<graph>
  <node  xml:id="gnex61"
    adjTo="#gnex62"
    adj="#gnex63"
    outDegree="2"
    type="initial">
    <label>1</label>
  </node>
  <node  xml:id="gnex62"
    adjFrom="#gnex61"
    adjTo="#gnex63"
    outDegree="1">
    <label>2</label>
  </node>
  <node  xml:id="gnex63"
    adjFrom="#gnex62"
    adj="#gnex61"
    outDegree="2"
    type="final">
    <label>3</label>
  </node>
</graph>
```

`@degree` gives the degree of the node, the number of arcs with which the node is incident.

Status Optional

Datatype teidata.count

```
<graph>
  <node  xml:id="gnex71"
    adjTo="#gnex72"
    adj="#gnex73"
    outDegree="1"
```

```
      inDegree="0"
      degree="1"
      type="initial">
      <label>1</label>
    </node>
    <node  xml:id="gnex72"
      adjFrom="#gnex71"
      adjTo="#gnex73"
      outDegree="1"
      inDegree="1"
      degree="0">
      <label>2</label>
    </node>
    <node  xml:id="gnex73"
      adjFrom="#gnex72"
      adj="#gnex71"
      outDegree="0"
      inDegree="1"
      degree="1"
      type="final">
      <label>3</label>
    </node>
  </graph>
```

Note Use this attribute instead of the *inDegree* and *outDegree* attributes when the graph is undirected and vice versa if the graph is directed.

Contained by: graph

May contain

core: label

Note Zero, one, or two children <label> elements may be present. The first occurrence of <label> provides a label for the arc; the second provides a second label for the arc, and should be used if a transducer is being encoded whose actions are associated with nodes rather than with arcs.

Example

```
<node  xml:id="t6"  type="final"  inDegree="2"
  outDegree="0">
  <label>6</label>
</node>
```

Note It is possible to describe the content of the notation using elements from the `model.labelLike` class and it is possible to point to an external representation using elements from `model.ptrLike`. It is possible to specify the location of digital objects representing the notated music in other media such as images or audio-visual files. The encoder's interpretation of the correspondence between the notated music and these digital objects is not encoded explicitly. We recommend the use of graphic and binaryObject mainly as a fallback mechanism when the notated music format is not displayable by the application using the encoding. The alignment of encoded notated music, images carrying the notation, and audio files is a complex matter for which we refer the encoder to other formats and specifications such as MPEG-SMR.

It is also recommended, when useful, to embed XML-based music notation formats, such as the Music Encoding Initiative format as content of <notatedMusic>. This must be done by means of customization.

Example

```
<notatedMusic>
  <ptr  target="bar1.xml"/>
  <graphic  url="bar1.jpg"/>
  <desc>First bar of Chopin's Scherzo No.3 Op.39</desc>
</notatedMusic>

character data

Example In the following example, the translator has supplied a footnote containing an explanation of the term translated as ”painterly”:

```
And yet it is not only
in the great line of Italian renaissance art, but even in the
painterly <note  place="bottom"  type="gloss"
  resp="#MDMH">
  <term  xml:lang="de">Malerisch</term>. This word has, in the German, two
distinct meanings, one objective, a quality residing in the object,
the other subjective, a mode of apprehension and creation. To avoid
confusion, they have been distinguished in English as
<mentioned>picturesque</mentioned> and
<mentioned>painterly</mentioned> respectively.
</note> style of the
Dutch genre painters of the seventeenth century that drapery has this
psychological significance.

<!-- elsewhere in the document -->
<respStmt  xml:id="MDMH">
  <resp>translation from German to English</resp>
  <name>Hottinger, Marie Donald Mackie</name>
</respStmt>
```

For this example to be valid, the code `MDMH` must be defined elsewhere, for example by means of a responsibility statement in the associated TEI header.

Example The global *n* attribute may be used to supply the symbol or number used to mark the note’s point of attachment in the source text, as in the following example:

```
Mevorakh b. Saadya's mother, the matriarch of the
family during the second half of the eleventh century,
<note  n="126"  anchored="true"> The
alleged mention of Judah Nagid's mother in a letter from 1071 is, in fact, a
reference to
Judah's children; cf. above, nn. 111 and 54. </note> is well known from Geniza
documents
published by Jacob Mann.
```

However, if notes are numbered in sequence and their numbering can be reconstructed automatically by processing software, it may well be considered unnecessary to record the note numbers.

Example In the following example, there are two notes in different languages, each specifying the content of the annotation relating to the same fragment of text:

```
<p>(...) tamen reuerendos dominos archiepiscopum et canonicos Leopolienses
necnon episcopum in duplicibus Quatuortemporibus
<noteGrp>
   <note  xml:lang="en">Quatuor Tempora, so called dry fast days (Wednesday,
Friday, and Saturday)
       falling on each of the quarters of the year. In the first quarter they
were called Cinerum
       (following Ash Wednesday), second Spiritus (following Pentecost), third
Crucis
       (after the Exaltation of the Holy Cross, September 14th), and Luciae
       in the fourth (after the feast of St. Lucia, December 13th).
   </note>
   <note  xml:lang="pl">Quatuor Tempora, tzw. Suche dni postne (środa, piątek i
sobota)
       przypadające cztery razy w roku. W pierwszym kwartale zwały się Cinerum
       (po Popielcu), w drugim Spiritus (po Zielonych Świętach), w trzecim
Crucis
       (po święcie Podwyższenia Krzyża 14 września), w czwartym Luciae
       (po dniu św. Łucji 13 grudnia).
```

```
      </note>
    </noteGrp>
  totaliter expediui.
  </p>
```

- att.typed
  - ~~type~~
  - @subtype

`@type` indicates the type of numeric value.

Derived from att.typed

Status Optional

Datatype teidata.enumerated

Suggested values include: **cardinal** absolute number, e.g. 21, 21.5

ordinal ordinal number, e.g. 21st

fraction fraction, e.g. one half or three-quarters

percentage a percentage

Note If a different typology is desired, other values can be used for this attribute.

`@value` supplies the value of the number in standard form.

Status Optional

Datatype teidata.numeric

Values a numeric value.

Note The standard form used is defined by the TEI datatype `teidata.numeric`.

- *@datcat*
- *@valueDatcat*
- *@targetDatcat*

`@value` supplies a lower bound for the numeric value represented, and also (if *max* is not supplied) its upper bound.
Status Required
Datatype teidata.numeric

`@max` supplies an upper bound for the numeric value represented.
Status Optional
Datatype teidata.numeric

`@trunc` specifies whether the value represented should be truncated to give an integer value.

Status Optional
Datatype teidata.truthValue

Member of model.featureVal.single
Contained by
iso-fs: f fvLib if vAlt vColl vDefault vLabel vMerge vNot vRange
May contain Empty element
Note It is an error to supply the *max* attribute in the absence of a value for the *value* attribute.
Example

```
<numeric value="42"/>
```

This represents the numeric value 42.
Example

```
<numeric value="42.45" max="50" trunc="true"/>
```

This represents any of the nine possible integer values between 42 and 50 inclusive. If the *trunc* attribute had the value FALSE, this example would represent any of the infinite number of numeric values between 42.45 and 50.0
Content model `<content> <empty/></content>`

msdescription: additional history msContents msDesc physDesc
namesdates: object objectIdentifier
Note The <object> element is a recent addition to the TEI P5 Guidelines as of version 3.5.0 and as such may be

more prone to further revision in the next few releases as its use develops. This may be particularly evident where its contents have been borrowed from <msDesc> and have yet to be generalized from their use in the context of manuscript descriptions.

The <object> element may be used for describing any object, text-bearing or not, though where the textuality of the object is the primary concern or a collection is mostly composed of manuscripts, encoders may prefer the <msDesc> element (a more specific form of <object>) which may be used not only to describe manuscripts but any form of text-bearing objects such as early printed books.

Example

```
<listObject>
  <object  xml:id="Alfred_Jewel">
    <objectIdentifier>
      <country>United Kingdom</country>
      <region>Oxfordshire</region>

        </location>
      </address>
    </objectIdentifier>
    <msContents>
      <p>The back and shoulders of the mask is inscribed with a protective spell
in Egyptian hieroglyphs formed of ten
           vertical and horizontal lines. This spell first appeared on masks in
the Middle Kingdom at least 500 years
           before Tutankhamun, and comes from chapter 151 of the <title>Book of
the Dead</title>.</p>
    </msContents>
    <physDesc>
      <p> The mask of Tutankhamun is 54cm x 39.3cm x 49cm. It is constructed
from two layers of high-karat gold that
           varies in thickness from 1.5-3mm. It weighs approximately 10.23kg
and x-ray crystallography shows that it is
           composed of two alloys of gold with a lighter 18.4 karat shade being
used for the face and neck while a heavier
           22.5 karat gold was used for the rest of the mask.</p>
      <p>In the mask Tutankhamun wears a nemes headcloth which has the royal
insignia of a cobra (Wadjet) and vulture
           (Nekhbet) on it. These are thought respectively to symbolize
Tutankhamun's rule of both Lower Egypt and Upper
           Egypt. His ears are pierced for earrings. The mask has rich inlays
of coloured glass and gemstones, including
           lapis lazuli surrounding the eye and eyebrows, quartz for the eyes,
obsidian for the pupils. The broad collar is
           made up of carnelian, feldspar, turquoise, amazonite, faience and
other stones.</p>
    </physDesc>
    <history>
      <origin>
        <p>The mask of Tutankhamun was created in <origPlace>Egypt</origPlace>
around <origDate  when="-1323"  type="circa">1323 BC</origDate>. It is a death
mask of the 18th-dynasty ancient Egyptian Pharaoh Tutankhamun
             who reigned 1332–1323 BC. </p>
```

```
      </origin>
      <provenance>
        <p>The mask of Tutankhamun was found in his burial chamber at Theban
Necropolis in the Valley of the Kings in
                1922. On 28 October 1925 the excavation team led by English
archaeologist Howard Carter opened the heavy
                sarcophagus and three coffins and were the first people in around
3,250 years to see the mask of Tutankhamun.
                Carter wrote in his diary: <quote> The pins removed, the lid was
raised. The penultimate scene was disclosed –
                    a very neatly wrapped mummy of the young king, with golden
mask of sad but tranquil expression, symbolizing
                    Osiris … the mask bears that god's attributes, but the
likeness is that of Tut.Ankh.Amen – placid and
                    beautiful, with the same features as we find upon his statues
and coffins. The mask has fallen slightly
                    back, thus its gaze is straight up to the heavens. </quote>
        </p>
      </provenance>
      <acquisition> In December 1925, the mask was removed from the tomb, placed
in a crate and transported 635
            kilometres (395 mi) to the Egyptian Museum in Cairo, where it
remains on public display. </acquisition>
    </history>
    <additional>
      <adminInfo>
        <custodialHist>
          <custEvent  when="1944">When it was discovered in 1925, the 2.5kg
narrow gold beard was no longer attached to
                    the mask and was reattached to the chin by use of a wooden
dowel in 1944.</custEvent>
          <custEvent  when="2014-08"> In August 2014 when the mask was removed
from its display case for cleaning, the
                    beard fell off again. Those working in the museum unadvisedly
used a quick-drying epoxy to attempt to fix
                    it, but left the beard off-centre. </custEvent>
          <custEvent  when="2015-01">The damage was noticed and repaired in
January 2015 by a German-Egyptian team who
                    used beeswax, a material known to be used as adhesives by the
ancient Egyptians.</custEvent>

- att.typed
  - ~~type~~
  - @subtype

`@type` characterizes the element in some sense, using any convenient classification scheme or typology.
Derived from att.typed
Status Optional
Datatype teidata.enumerated
Sample values include: **primary**
other
paid
unpaid

`@scheme` indicates the classification system or taxonomy in use, for example by supplying the identifier of a <taxonomy> element, or pointing to some other resource.
Status Optional
Datatype teidata.pointer

`@code` identifies an occupation code defined within the classification system or taxonomy defined by the *scheme* attribute.
Status Optional
Datatype teidata.pointer

  - ~~type~~
  - @subtype

`@type` indicates the kind of typographic modification made to the headword in the reference.

Derived from att.typed

Status Optional

Datatype teidata.enumerated

Sample values include: **cap** (capital) indicates first letter is given as capital

noHyph (no hyphen) indicates that the headword, though a prefix or suffix, loses its hyphen

`@role` specifies a primary role or classification for the organization.

Status Optional

Datatype 1–∞ occurrences of teidata.enumerated separated by whitespace

Note Values for this attribute may be locally defined by a project, using arbitrary keywords such as artist, employer, familyGroup, or politicalParty, each of which should be associated with a definition. Such local definitions will typically be provided by a <desc> for each <valItem> element in the schema specification of the project's customization.

character data

Example If all that is desired is to call attention to the original version in the copy text, <orig> may be used alone:

```
<l>But this will be a <orig>meere</orig> confusion</l>
<l>And hardly shall we all be <orig>vnderstoode</orig>
</l>
```

Example More usually, an <orig> will be combined with a regularized form within a <choice> element:

```
<l>But this will be a <choice>
    <orig>meere</orig>
    <reg>mere</reg>
  </choice> confusion</l>
<l>And hardly shall we all be <choice>
    <orig>vnderstoode</orig>
    <reg>understood</reg>
  </choice>
</l>
```

Content model

```

`@scope` provides a way of defining 'pseudo-elements', that is, styling rules applicable to specific sub-portions of an element.

Status Optional

Datatype teidata.enumerated

Sample values include: **first-line** styling applies to the first line of the target element.

first-letter styling applies to the first character of the target element.

before styling should be applied immediately before the content of the target element.

after styling should be applied immediately after the content of the target element.

May contain Character data only

Note This component of an element specification describes the rendering or appearance intended for all occurrences of the element in a specified context for a specified type of output. The <rendition> element, by contrast, describes the actual rendering or appearance of all occurrences of the specified element in a source document. The *useSourceRendition* attribute may however be used to indicate that formatting information provided by a <rendition> element is to be combined with any provided by an <outputRendition> element.

It is strongly recommended that the W3C Cascading Stylesheet language (CSS2 or later) be used to express the required formatting information.

Example

```
<model predicate="ancestor::p"
  behaviour="inline">
  <outputRendition>font-style: italic;</outputRendition>
</model>
<model behaviour="block">
  <outputRendition>left-margin: 2em;</outputRendition>
</model>
```

Content model `<content> <textNode/></content>`

Schema Declaration

`@name` a name for the parameter being supplied.

Status Required

Datatype teidata.enumerated

Suggested values include: **alternate** when used with behaviour `alternate`, a parameter of this name supplies one of the pair of possible values; for example the regularized form rather than the original form within a <choice> element.

default when used with behaviour `alternate`, a parameter of this name supplies one of the pair of possible values; for example the original form rather than the regularized form within a <choice> element.

height when used with behaviour `graphic`, a parameter of this name supplies a value for the height of the graphic e.g. '300px', '50%'.

id a parameter of this name should supply a unique identifier for the element being processed; as for example with the `anchor` behaviour

label a parameter of this name should supply an expression to be used to label

something, for example `concat('Page ', @n)` for a page beginning or `@n` for a footnote reference; typically used with the `note` or `break` behaviours

level when used with the `heading` behaviour, a parameter of this name supplies a positive integer indicating the hierarchic level of a heading.

link when used with the `link` behaviour, a parameter of this name should supply a URL to be used as the target of a link.

place when used with the `note` behaviour, a parameter of this name should provide a string which describes the intended placement of some text; typical values include 'margin', 'footnote', 'endnote', 'inline', 'bottom'

type a parameter of this name can be used to categorize the specified behaviour in any way; for example the kind of break (when used with the `break` behaviour) or the kind of index to be generated (if used with the `index` behaviour) etc.

url when used with behaviour `graphic`, a parameter of this name supplies a a URL indicating the graphic intended.

width when used with behaviour `graphic`, a parameter of this name supplies a value for the width of the graphic e.g. '400px', '70%'.

`@value` supplies an XPath expression which when evaluated provides the value for the parameter

Status Required

Datatype teidata.xpath

Contained by tagdocs: model

May contain Empty element

Note An implementation may require parameters other than those listed here, and is not required to follow this partial specification.

The names and datatypes of the expected parameters should be documented in the corresponding customization using a <paramSpec> element. Literal strings provided in an XPath expression should be quoted.

Example In this example, which will be processed for a <choice> element which has both <sic> and <corr> child elements, the `default` parameter will provide the value of the child <corr> element, and the `alternate` parameter will provide that of the child <sic> elements. If neither <param> element was supplied, both elements would still be available to an application, but the application would need to distinguish them for itself.

```
<elementSpec ident="choice">
  <model predicate="sic and corr"
    behaviour="alternate">
    <param name="default" value="corr"/>
    <param name="alternate" value="sic"/>
  </model>
</elementSpec>
```

Example

```
<elementSpec ident="graphic" mode="change">
  <model behaviour="graphic">
    <param name="url" value="@url"/>
    <param name="width" value="@width"/>
    <param name="height" value="@height"/>
  </model>
</elementSpec>
```

Content model `<content> <empty/></content>`

Schema Declaration

```
element param

May contain
core: desc gloss
tagdocs: equiv
Note Where a model behaviour uses more than one parameter, individual <paramSpec> elements should be grouped together using a <paramList> element, as above. Parameter specifications are provided within the <valItem> used to define a particular behaviour, which forms part of the specification of a <model> element's *behaviour* attribute. In the example above, the behaviour `link` has two parameters: content and link.

Using a <desc> element within a <paramSpec> is optional but recommended practice.

Example

```
<valItem ident="link">
  <desc>create a hyperlink</desc>
  <paramList>
    <paramSpec ident="content">
      <desc>supplies the location of some content describing the link</desc>
    </paramSpec>
    <paramSpec ident="link">
      <desc>supplies the location of the intended URL</desc>
    </paramSpec>
  </paramList>
</valItem>
```

Content model

```
<content>
 <alternate minOccurs="0"
  maxOccurs="unbounded">
  <classRef key="model.identEquiv"/>
  <classRef key="model.descLike"/>
 </alternate>
</content>
```

Schema Declaration

```
element paramSpec
{
   att.global.attributes,
   att.global.analytic.attributes,
   att.global.change.attributes,
   att.global.facs.attributes,
   att.global.linking.attributes,
   att.global.rendition.attributes,
```

```
   att.global.responsibility.attributes,
   att.global.source.attributes,
   att.identified.attributes,
   att.combinable.attributes,
   att.deprecated.attributes,
   ( model.identEquiv | model.descLike )*
}
```

<particDesc> (participation description) describes the identifiable speakers, voices, or other participants in any kind of text or other persons named or otherwise referred to in a text, edition, or metadata. [*16.2. Contextual Information*]

Member of model.profileDescPart

Contained by

header: profileDesc

May contain

core: p

linking: ab

namesdates: listOrg listPerson org person personGrp

Note May contain a prose description organized as paragraphs, or a structured list of persons and person groups, with an optional formal specification of any relationships amongst them.

Example

```
<particDesc>
  <listPerson>
    <person  xml:id="P-1234"  sex="2"  age="mid">
      <p>Female informant, well-educated, born in
            Shropshire UK, 12 Jan 1950, of unknown occupation. Speaks French
fluently.
            Socio-Economic status B2.</p>
    </person>
    <person  xml:id="P-4332"  sex="1">
      <persName>
        <surname>Hancock</surname>
        <forename>Antony</forename>
        <forename>Aloysius</forename>
        <forename>St John</forename>
      </persName>
      <residence  notAfter="1959">
        <address>
          <street>Railway Cuttings</street>
          <settlement>East Cheam</settlement>
        </address>
      </residence>
      <occupation>comedian</occupation>
    </person>
    <listRelation>
      <relation  type="personal"  name="spouse"
        mutual="#P-1234 #P-4332"/>
    </listRelation>
  </listPerson>
</particDesc>
```

This example shows both a very simple person description, and a very detailed one, using some of the more specialized elements from the module for Names and Dates.

Schematron <sch:pattern is-a="declarable"> <sch:param name="tde" value="tei:particDesc"/> </sch:pattern>

Content model

  - *@hand*
- att.coordinated
  - ~~points~~
  - @start
  - @ulx
  - @uly
  - @lrx
  - @lry

`@points` identifies a line within the container or bounding box specified by the parent element by means of a series of two or more pairs of numbers, each of which gives the x,y coordinates of a point on the line.
Derived from att.coordinated
Status Optional
Datatype 2–∞ occurrences of teidata.point separated by whitespace

Member of model.linePart
Contained by
transcr: line surface zone
May contain Empty element
Note Although the simplest form of a path is a straight line between two points, a line with more than two points may bend at any point. The order of coordinates in *points* is significant, because the line follows the coordinate sequence.

To specify a closed polygon, use the <zone> element rather than the <path> element.
Example

```
<surface ulx="0" uly="0" lrx="443" lry="272">
  <graphic url="facs-fig3.jpg"/>
  <path points="74,73 171,244"/>
  <path points="71,203 173,116"/>
</surface>
```

Schematron Since a <path> represents a line with distinct start and end points, the last coordinate should not be the same as the first coordinate. <sch:rule context="tei:path[@points]"> <sch:let name="firstPair" value="tokenize(normalize-space(@points), ' ')[1]"/> <sch:let name="lastPair" value="tokenize(normalize-space(@points), ' ')[last()]"/> <sch:let name="firstX" value="xs:float(substring-before($firstPair, ','))"/> <sch:let name="firstY" value="xs:float(substring-after($firstPair, ','))"/>

<sch:let name="lastX" value="xs:float(substring-before($lastPair, ','))"/> <sch:let name="lastY" value="xs:float(substring-after($lastPair, ','))"/> <sch:report test="$firstX eq $lastX and $firstY eq $lastY">The first and last elements of this path are the same. To specify a closed polygon, use the <zone> element rather than the <path> element. </sch:report> </sch:rule>

Content model `<content> <empty/></content>`

Schema Declaration

May contain Empty element

Note A <pb> element should appear at the start of the page which it identifies. The global *n* attribute indicates the number or other value associated with this page. This will normally be the page number or signature printed on it, since the physical sequence number is implicit in the presence of the <pb> element itself.

The *type* attribute may be used to characterize the page beginning in any respect. The more specialized attributes *break*, *ed*, or *edRef* should be preferred when the intent is to indicate whether or not the page beginning is word-breaking, or to note the source from which it derives.

Example Page numbers may vary in different editions of a text.

```
<p> ... <pb  n="145"  ed="ed2"/>
<!-- Page 145 in edition "ed2" starts here --> ... <pb  n="283"  ed="ed1"/>
<!-- Page 283 in edition "ed1" starts here--> ... </p>
```

Example A page beginning may be associated with a facsimile image of the page it introduces by means of the *facs* attribute

```
<body>
  <pb  n="1"  facs="page1.png"/>
<!-- page1.png contains an image of the page;
the text it contains is encoded here -->
  <p>
<!-- ... -->
  </p>
  <pb  n="2"  facs="page2.png"/>
<!-- similarly, for page 2 -->
  <p>
<!-- ... -->
  </p>
</body>
```

Content model `<content> <empty/></content>`

`@force` indicates the extent to which this punctuation mark conventionally separates words or phrases.
Status Optional
Datatype teidata.enumerated
Legal values are: **strong** the punctuation mark is a word separator
weak the punctuation mark is not a word separator
inter the punctuation mark may or may not be a word separator

`@unit` provides a name for the kind of unit delimited by this punctuation mark.
Status Optional
Datatype teidata.enumerated

`@pre` indicates whether this punctuation mark precedes or follows the unit it delimits.
Status Optional
Datatype teidata.truthValue

  - *@sortKey*

`@role` specifies a primary role or classification for the person.

Status Optional

Datatype 1–∞ occurrences of teidata.enumerated separated by whitespace

Note Values for this attribute may be locally defined by a project, using arbitrary keywords such as artist, employer, author, relative, or servant, each of which should be associated with a definition. Such local definitions will typically be provided by a <valList> element in the project schema specification.

`@sex` specifies the sex of the person.

Status Optional

Datatype 1–∞ occurrences of teidata.sex separated by whitespace

Note Values for this attribute may be defined locally by a project, or they may refer to an external standard.

`@gender` specifies the gender of the person.

Status Optional

Datatype 1–∞ occurrences of teidata.gender separated by whitespace

Note Values for this attribute may be defined locally by a project, or they may refer to an external standard.

`@age` specifies an age group for the person.

Status Optional

Datatype teidata.enumerated

Note Values for this attribute may be locally defined by a project, using arbitrary keywords such as infant, child, teen, adult, or senior, each of which should be associated with a definition. Such local definitions will typically be provided by a <valList> element in the project schema specification.

Note May contain either a prose description organized as paragraphs, or a sequence of more specific demographic elements drawn from the `model.personPart` class.

Example

```
<person sex="F" age="adult">
  <p>Female respondent, well-educated, born in Shropshire UK, 12 Jan 1950, of
unknown occupation. Speaks French fluently. Socio-Economic
    status B2.</p>
</person>
```

Example

```
<person sex="intersex" role="god"
  age="immortal">
  <persName>Hermaphroditos</persName>
  <persName xml:lang="grc">Ἑρμαφρόδιτος</persName>
</person>
```

Example

```
<person xml:id="Ovi01" sex="M" role="poet">
  <persName xml:lang="en">Ovid</persName>
  <persName xml:lang="la">Publius Ovidius Naso</persName>
```

```
  <birth  when="-0044-03-20"> 20 March 43 BC <placeName>
     <settlement  type="city">Sulmona</settlement>
     <country  key="IT">Italy</country>
    </placeName>
  </birth>
  <death  notBefore="0017"  notAfter="0018">17 or 18 AD <placeName>
     <settlement  type="city">Tomis (Constanta)</settlement>
     <country  key="RO">Romania</country>
    </placeName>
  </death>
</person>
```

Example The following exemplifies an adaptation of the vCard standard to indicate an unknown gender for a fictional character.

```
<person  xml:id="ariel"  gender="U">
  <persName>Ariel</persName>
  <note>Character in <title  level="m">The Tempest</title>.</note>
</person>
```

Example This example demonstrates the use of a <ref> element to provide more information about a person. The private URI scheme *lacy:* is presumably declared in the <teiHeader> with a <prefixDef>.

```
<person  age="G2"  role="author"
  xml:id="W0212"  sex="F">
  <birth  when="1787"/>
  <death  when="1855"/>
  <persName  type="main">Mitford, Mary Russell (1787–1855)</persName>

Note Note that a persona is not the same as a role. A role may be assumed by different people on different occasions, whereas a persona is unique to a particular person, even though it may resemble others. Similarly, when an actor takes on or enacts the role of a historical person, they do not thereby acquire a new persona.

Example

```
<person sex="M" age="adult">
  <persona sex="M">
    <persName>Dr Henry Jekyll</persName>
  </persona>
  <persona sex="M" age="youth">
    <persName>Edward Hyde</persName>

`@role` specifies the role of this group of participants in the interaction.
Status Optional
Datatype 1–∞ occurrences of teidata.enumerated separated by whitespace
Note Values for this attribute may be locally defined by a project, using arbitrary keywords such as movement, employers, relatives, or servants, each of which should be associated with a definition. Such local definitions will typically be provided by a <valList> element in the project schema specification.

`@sex` specifies the sex of the participant group.
Status Optional
Datatype 1–∞ occurrences of teidata.sex separated by whitespace
Note Values for this attribute may be defined locally by a project, or they may refer to an external standard.

`@gender` specifies the gender of the participant group.
Status Optional
Datatype 1–∞ occurrences of teidata.gender separated by whitespace
Note Values for this attribute may be defined locally by a project, or they may refer to an external standard.

`@age` specifies the age group of the participants.
Status Optional
Datatype teidata.enumerated
Note Values for this attribute may be locally defined by a project, using arbitrary keywords such as infant, child, teen, adult, or senior, each of which should be associated with a definition. Such local definitions will typically be provided by a <valList> element in the project schema specification.

`@size` describes informally the size or approximate size of the group for example by means of a number and an indication of accuracy e.g. approx 200.
Status Optional
Datatype 1–∞ occurrences of teidata.word separated by whitespace

`@evidence` (evidence) indicates support for the listed personal pronouns.

Status Recommended

Datatype teidata.enumerated

Suggested values include: **conjecture** (conjecture) The given value was selected based on assumptions by someone besides the person to whom this pronoun applies. As a result, the value may be erroneous.

selfIdentification (self identification) The given value has been explicitly stated or confirmed by the person to whom this pronoun applies.

trustedThirdParty (trusted third party) The given value has been supplied by another individual trusted by the encoder to know the preferences of the person to whom this pronoun applies.

`@value` (value) supplies a regularized value for personal pronouns.

Status Recommended

Datatype 1–∞ occurrences of teidata.enumerated separated by whitespace

Sample values include: **e** (e) e/eirs

he (he) he/him/his

she (she) she/her/hers

they (they) they/them/theirs

Note The sample values list shown here is intended to be reflective of English usage. There is nothing restricting users from defining lists reflective of other languages, e.g. elle, il, and ils.

`@modality` written or spoken mode.
Status Recommended

Datatype teidata.enumerated

Suggested values include: **written** for stretches of text and/or multimodal elements

spoken (for audio (or audio-visual) posts)

Note This attribute is intended to convey information about the CMC environment in which the post was created, as opposed to the MIME type of the content conveyed, which is indicated by the elements contained within the <post>.

`@replyTo` indicates to which previous post the current post replies or refers.

Status Optional

Datatype 1–∞ occurrences of teidata.pointer separated by whitespace

Note This attribute should be used to encode 'technical' reply information that is due to a formal reply action (such as activating a 'reply' button in the client software) and that is formally represented in the source, e.g. in the 'references' field of a Usenet message header or in the subject line of a forum post. It should not be used for inferred or interpreted reply relations based only on ambiguous signs such as linguistic discourse markers or indentation.

character data

Note Even though in some CMC genres (e.g., WhatsApp), the other parties are informed by an automated alert about the fact that another party is currently composing a new post, they cannot track the process of verbalization, i.e. how the written utterance emerges in the entry form on the user interface of its author. It is not until the author performs a 'posting' action (e.g., by hitting the 'enter' key or by activating a 'send' button with the mouse) that the result of the composition process — the post — is made available for the other parties. From the perspective of its addressees/readers, a post is a stretch of text that has been composed in advance. Different from spoken utterances but similar to edited text, (1) the reader of a post does not have access to the verbalization process and (2) the mental processing of a post is not possible until the process of verbalization (the composition) has been finished and the posting action has been performed by the author. Posts occur in a broad range of written CMC genres: as user 'messages' in chats and WhatsApp dialogues, as SMS messages, as tweets in Twitter timelines, as individual comments following a status update on Facebook pages, as posts in forum threads, as contributions on Wikipedia talk pages or in the comments section of a weblog. [Element adopted from the DeRiK schema. Aspects of the model adopted from the CoMeRe Schema]. The <post> element is a member of the model class model.common (via model.CMC). This allows for using (and combining) occurrences of <post>, <u>, <incident>, and <kinesic>in one and the same in order to be able to represent the combined use of written and spoken utterances and nonverbal acts on the GUI of multimodal CMC environments.

The use of the *modality* attribute is recommended, but not required. Its value is either written or spoken. Because spoken language differs fundamentally from written language, when the value is spoken projects may wish to limit the content of the <post> to character data and only those elements available in the <u> element, thus avoiding elements like <p> or <head> that are used for the encoding of written text.

Example standard user postings in chat

```
<post type="standard" generatedBy="human"
  who="#A05" rend="color:red">
  <p>oh ja, in die Wärme...</p>
</post>
<post type="standard" generatedBy="human"
  who="#A03" rend="color:red">
  <p>nein, hast du nicht !!</p>
</post>
```

Example chat message-type "system": user enters a chatroom, "system" defined in listPerson

```
<listPerson>
  <person xml:id="system">
    <persName>system</persName>
  </person>
<!-- ... -->
</listPerson>
<!-- ... -->
<post type="event" generatedBy="system"
  who="#system" rend="color:navy">
  <p>
    <name type="nickname" corresp="#A07">Interseb</name> betritt den Raum.</p>
</post>
```

Example action message in chat

```
<post type="event" generatedBy="human"
  who="#A02" rend="color:blue">
  <p>
```

```
    <name type="nickname" corresp="#A02">McMike</name> hechtet zum Steuer </p>
  </post>
```

Example chat messages incl. interaction words (types: inflective and acronym) and an interaction phrase

```
  <post type="standard" generatedBy="human"
   who="#A03" rend="color:green">
   <p>
    <w type="AKWIND">*</w>
    <w type="AKW" subtype="inflective">schwank</w>
    <w type="AKWIND">*</w>
  <!-- ... -->
    <w type="AKWIND">*</w>
    <w type="AKW">seekrank</w>
    <w type="AKWIND">*</w>
   </p>
  </post>
  <!-- ... -->
  <post type="standard" generatedBy="human"
   who="#A02" rend="color:blue">
   <p>
    <w type="AKWIND">*</w>
    <w type="AKW" subtype="acronym">lol</w>
    <w type="AKWIND">*</w> ... </p>
  </post>
  <!-- ... -->
  <post type="standard" generatedBy="human"
   who="#A01" rend="color:black">
   <p>
    <phr type="AKW">
     <w type="AKWIND">*</w>
     <name type="nickname" corresp="#A02">McMike</name> einen fallschirm
  <w type="AKW" subtype="inflective">umbind</w>
     <w type="AKWIND">*</w>
    </phr>
   </p>
  </post>
```

Example user posting incl. an emoticon

```
  <post type="standard" generatedBy="human"
   who="#A01" rend="color:black">
   <p> naja, der war gestrandet <w type="emoticon" subtype="ascii">:(</w>
   </p>
  </post>
```

Example Twitter: Tweet containing an addressing term and a hashtag expression

```
  <post type="standard" generatedBy="human"
   who="#A01" when="2015-11-18">
   <p>
    <ref corresp="#A02"
     target="https://twitter.com/textarchiv">
     <w type="ADRIND">@</w>
     <w type="ADR">textarchiv</w>
    </ref> Erfurter
     Europäische Welt- und Staats-Geschichte: 20 Ausgaben von 1744 aus dem MKHZ
```

```
    bereits in DTAQ
<ref target="http://www.deutschestextarchiv.de/dtaq/about">
http://www.deutschestextarchiv.de/dtaq/about</ref>
   <ref target="https://twitter.com/hashtag/dtaclarin14?src=hash">
    <w type="hashtag">#dtaclarin14</w>
   </ref>
  </p>
</post>
```

Example example from Wikipedia discussion

```
<post type="standard" generatedBy="human"
 indentLevel="3" synch="#t02622878" who="#WU00018921">
 <p> Wie du siehst hab ich die Lemma geändert, danke für den Hinweis, ich war
nämlich
    selbst auch etwas unsicher bei der ganzen Sache und bin jetzt damit auch
viel
    glücklicher!--</p>
 <signed rend="inline"
  generatedBy="template">
  <gap reason="signatureContent"/>
  <time generatedBy="template">12:01, 12. Jun. 2009 (CEST)</time>
 </signed>
</post>
```

Example Blog comment: Die Anthropodizee-Frage. Wer den Himmel leerräumt, schafft die Menschheit ab. by Volker Birk.
??ttps://scilogs.spektrum.de/natur-des-glaubens/die-anthropodizee-frage-wer-himmel/#comment-31899

```
<post xml:id="p5" type="comment" who="#u4"
 synch="#t005" replyTo="#p4">
 <p>“Wenn Sie diesen Gruppen also “mangelnde Bildung“ attestieren wollen, so
    verwenden Sie bereits einen bestimmten, kulturgebundenen
Bildungsbegriff.”</p>
 <p>Ich hoffe doch, wir können beim Bildungsbegriff der Aufklärung bleiben.
Wer das
    nicht möchte, hat die Wissenschaft verlassen.</p>
</post>
```

Example Usenet reply that comments on material quoted in an earlier message.

```
<post when="1990-10-11" who="#dmerritt"
 xml:id="sgml-tei-3" replyTo="#sgml-tei-1">
 <time generatedBy="system">04:37:51 UTC</time>
 <p>
  <seg generatedBy="system">In article
  <ref target="#sgml-tei-1"><2****.**********0@m*******.***.*****.**c.uk></ref>

<prefixDef> (prefix definition) defines a prefixing scheme used in `teidata.pointer` values, showing how abbreviated URIs using the scheme may be expanded into full URIs. [*17.2.3. Using Abbreviated Pointers*]

Module header — The TEI Header

Attributes

- att.patternReplacement
  - *@matchPattern*
  - *@replacementPattern*

`@ident` supplies a name which functions as the prefix for an abbreviated pointing scheme such as a private URI scheme. The prefix constitutes the text preceding the first colon.

Status Required

Datatype teidata.prefix

Note The value is limited to `teidata.prefix` so that it may be mapped directly to a URI prefix.

Contained by: listPrefixDef

May contain

core: p

linking: ab

Note Note that we used the term 'prefix' in a general sense; in the context of a `teidata.pointer` attribute, the prefix functions as a private URI scheme name as defined in RFC 7595.

The abbreviated pointer may be dereferenced to produce either an absolute or a relative URI reference. In the latter case it is combined with the value of *xml:base* in force at the place where the pointing attribute occurs to form an absolute URI in the usual manner as prescribed by XML Base.

Example

```
<prefixDef  ident="ref"
  matchPattern="([a-z]+)"
  replacementPattern="../../references/references.xml#$1">
  <p> In the context of this project, private URIs with
     the prefix "ref" point to <gi>div</gi> elements in
     the project's global references.xml file.
  </p>
</prefixDef>
```

Content model

```
<content>
 <classRef key="model.pLike" minOccurs="0"
  maxOccurs="unbounded"/>
</content>
```

Schema Declaration

```
element prefixDef
{
   att.global.attributes,
   att.global.analytic.attributes,
   att.global.change.attributes,
   att.global.facs.attributes,
   att.global.linking.attributes,

- att.typed
- ~~type~~
- @subtype

`@type` a keyword characterizing the type of preparedness.
Derived from att.typed
Status Optional
Datatype teidata.enumerated
Sample values include: **none** spontaneous or unprepared
scripted follows a script
formulaic follows a predefined set of conventions
revised polished or revised before presentation

tagdocs: listRef

Note Where a publication statement contains several members of the `model.publicationStmtPart.agency` or `model.publicationStmtPart.detail` classes rather than one or more paragraphs or anonymous blocks, care should be taken to ensure that the repeated elements are presented in a meaningful order. It is a conformance requirement that elements supplying information about publication place, address, identifier, availability, and date be given following the name of the publisher, distributor, or authority concerned, and preferably in that order.

Example

```
<publicationStmt>
  <publisher>C. Muquardt </publisher>
  <pubPlace>Bruxelles & Leipzig</pubPlace>
  <date  when="1846"/>
</publicationStmt>
```

Example

```
<publicationStmt>
  <publisher>Chadwyck Healey</publisher>
  <pubPlace>Cambridge</pubPlace>
  <availability>
    <p>Available under licence only</p>
  </availability>
  <date  when="1992">1992</date>
</publicationStmt>
```

Example

```
<publicationStmt>
  <publisher>Zea Books</publisher>
  <pubPlace>Lincoln, NE</pubPlace>
  <date>2017</date>
  <availability>
    <p>This is an open access work licensed under a Creative Commons
Attribution 4.0 International license.</p>
  </availability>
  <ptr  target="http://digitalcommons.unl.edu/zeabook/55"/>
</publicationStmt>
```

Content model

`@marks` indicates whether or not punctation marks have been retained as content within the text.
Status Optional
Datatype teidata.enumerated
Legal values are: **none** no punctuation marks have been retained
some some punctuation marks have been retained
all all punctuation marks have been retained

`@placement` indicates the positioning of punctuation marks that are associated with marked up text as being encoded within the element surrounding the text or immediately before or after it.
Status Optional
Datatype teidata.enumerated
Legal values are: **internal** punctuation marks found at the start or end of a marked up text component are included within its surrounding element;
external punctuation marks found at the start or end of a marked up text component appear immediately before or after the surrounding element

Member of model.editorialDeclPart
Contained by
header: editorialDecl
May contain
core: p
linking: ab
Example

```
<punctuation  marks="all"
  placement="internal">
  <p>All punctuation marks in the source text have been retained and
represented using the
    appropriate Unicode code point. In cases where a punctuation mark and
nearby markup convey
    the same information (for example, a sentence ends with a question mark
and is also tagged
    as <gi>s</gi>) the punctuation mark is captured as content within the
element.</p>
</punctuation>
```

Example External placement of punctuation:

```
<p>I would agree with Saint Augustine that “<quote>An unjust law is no law at
all</quote>.”</p>
```

Example Internal placement of punctuation:

```
<p>I would agree with Saint Augustine that <quote>“An unjust law is no law at
all.”</quote>
</p>
```

character data

Note May be used to indicate that a passage is distinguished from the surrounding text for reasons concerning which no claim is made. When used in this manner, <q> may be thought of as syntactic sugar for <hi> with a value of *rend* that indicates the use of such mechanisms as quotation marks.

Example

```
It is spelled <q>Tübingen</q> – to enter the
letter <q>u</q> with an umlaut hold down the <q>option</q> key and press
<q>0 0 f c</q>
```

Content model

```
<content>
 <macroRef key="macro.specialPara"/>
</content>
```

Schema Declaration

```

character data

Note If a bibliographic citation is supplied for the source of a quotation, the two may be grouped using the <cit> element.

Example

```
Lexicography has shown little sign of being affected by the
work of followers of J.R. Firth, probably best summarized in his
slogan, <quote>You shall know a word by the company it
keeps</quote>
<ref>(Firth, 1957)</ref>

May contain Empty element

Example

```
<line>
  <redo  hand="#g_t"  target="#redo-1"
    cause="fix"/>
  <mod  xml:id="redo-1"  rend="strikethrough"
    spanTo="#anchor-1"  hand="#g_bl"/>Ihr hagren, triſten,
krummgezog<mod  rend="strikethrough">nen</mod>ener Nacken
</line>
<line>Wenn ihr nur piepſet iſt die Welt ſchon matt.<anchor  xml:id="anchor-1"/>
</line>
```

This encoding represents the following sequence of events:

- ”Ihr hagren, tristen, krummgezog nenener Nacken/ Wenn ihr nur piepset ist die Welt schon matt.” is written
- the redundant letters ”nen” in ”nenener” are deleted
- the whole passage is deleted by hand `g_bl` using strikethrough
- the deletion is reasserted by another hand (identified here as `g_t`)

Content model `<content> <empty/></content>`

linking: ab
Example

```
<refsDecl>
  <cRefPattern  matchPattern="([A-Za-z0-9]+) ([0-9]+):([0-9]+)"
    replacementPattern="#xpath(//body/div[@n='$1']/div[$2]/div3[$3])"/>
</refsDecl>
```

This example is a formal representation for the referencing scheme described informally in the following example.

Example

```
<refsDecl>
  <p>References are made up by concatenating the value for the
  <att>n</att> attribute on the highest level <gi>div</gi>
     element, followed by a space, followed by the sequential
     number of the next level <gi>div</gi> followed by a colon
     followed by the sequential number of the next (and lowest)
     level <gi>div</gi>.</p>
</refsDecl>
```

Schematron <sch:pattern is-a=”declarable”> <sch:param name=”tde” value=”tei:refsDecl”/> </sch:pattern>
Content model

```
<content>
 <alternate>
  <classRef key="model.pLike" minOccurs="1"
   maxOccurs="unbounded"/>
  <elementRef key="citeStructure"
   minOccurs="1" maxOccurs="unbounded"/>
  <elementRef key="cRefPattern"
```

```
   minOccurs="1" maxOccurs="unbounded"/>
  <elementRef key="refState" minOccurs="1"
   maxOccurs="unbounded"/>
 </alternate>
</content>
```

Schema Declaration

```
element refsDecl
{
   att.global.attributes,
   att.global.analytic.attributes,
   att.global.change.attributes,
   att.global.facs.attributes,
   att.global.linking.attributes,
   att.global.rendition.attributes,
   att.global.responsibility.attributes,
   att.global.source.attributes,
   att.declarable.attributes,
   ( model.pLike+ | citeStructure+ | cRefPattern+ | refState+ )
}
```

<refState> (reference state) specifies one component of a canonical reference defined by the milestone method. [*2.3.6.3. Milestone Method 2.3.6. The Reference System Declaration*]

  - *@unit*

`@length` specifies the fixed length of the reference component.

Status Optional

Datatype teidata.count

Note When constructing a reference, if the reference component found is of numeric type, the length is made up by inserting leading zeros; if it is not, by inserting trailing blanks. In either case, reference components are truncated if necessary at the right hand side.

When seeking a reference, the length indicates the number of characters which should be compared. Values longer than this will be regarded as matching, if they start correctly. If no value is provided, the length is unlimited and goes to the next delimiter or to the end of the value.

`@delim` (delimiter) supplies a delimiting string following the reference component.

Status Optional

Datatype teidata.text

Contained by: refsDecl

May contain Empty element

Example

```
<refState unit="book" delim=":"/>
<refState unit="line" length="4"/>
```

Content model `<content> <empty/></content>`

Schema Declaration

```
element refState
{
   att.global.attributes,
   att.global.analytic.attributes,
   att.global.change.attributes,
   att.global.facs.attributes,
   att.global.linking.attributes,
   att.global.rendition.attributes,
   att.global.responsibility.attributes,
```

```
   att.global.source.attributes,
   att.edition.attributes,
   att.milestoneUnit.attributes,
   attribute length { text }?,
   attribute delim { text }?,
   empty
}
```

<reg> (regularization) contains a reading which has been regularized or normalized in some sense. [*3.5.2. Regularization and Normalization 13. Critical Apparatus*]

character data

Example If all that is desired is to call attention to the fact that the copy text has been regularized, <reg> may be used alone:

```
<q>Please <reg>knock</reg> if an <reg>answer</reg> is <reg>required</reg>
</q>
```

Example It is also possible to identify the individual responsible for the regularization, and, using the <choice> and <orig> elements, to provide both the original and regularized readings:

```
<q>Please <choice>
    <reg  resp="#LB">knock</reg>
    <orig>cnk</orig>
  </choice> if an <choice>
    <reg>answer</reg>
    <orig>nsr</orig>
  </choice> is <choice>
    <reg>required</reg>
    <orig>reqd</orig>
  </choice>
</q>
```

`@name` supplies a name for the kind of relationship of which this is an instance.
Status Optional
Datatype teidata.enumerated

`@active` identifies the 'active' participants in a non-mutual relationship, or all the participants in a mutual one.
Status Optional
Datatype 1–∞ occurrences of teidata.pointer separated by whitespace

`@mutual` supplies a list of participants amongst all of whom the relationship holds equally.
Status Optional
Datatype 1–∞ occurrences of teidata.pointer separated by whitespace

`@passive` identifies the 'passive' participants in a non-mutual relationship.
Status Optional
Datatype 1–∞ occurrences of teidata.pointer separated by whitespace

Contained by *core:* listBibl
namesdates: event listEvent listNym listObject listOrg listPerson listPlace listRelation
May contain
core: desc
Note Only one of the attributes *active* and *mutual* may be supplied; the attribute *passive* may be supplied only if the attribute *active* is supplied. Not all of these constraints can be enforced in all schema languages.
Example

```
<relation type="social" name="supervisor"
  active="#p1" passive="#p2 #p3 #p4"/>
```

This indicates that the person with identifier p1 is supervisor of persons p2, p3, and p4.

Example

```
<relation type="personal" name="friends"
  mutual="#p2 #p3 #p4"/>
```

This indicates that p2, p3, and p4 are all friends.

Example

```
<relation type="CRM"
  name="P89_falls_within"
  active="http://id.clarosnet.org/places/metamorphoses/place/italy-orvieto"
  passive="http://id.clarosnet.org/places/metamorphoses/country/IT"/>
```

This indicates that there is a relation, defined by CIDOC CRM, between two resources identified by URLs.

Example

```
<relation resp="http://viaf.org/viaf/44335536/"
  ref="http://purl.org/saws/ontology#isVariantOf"
  active="http://www.ancientwisdoms.ac.uk/cts/urn:cts:greekLit:tlg3017.Syno298.sawsGrc01:dive
  passive="http://data.perseus.org/citations/urn:cts:greekLit:tlg0031.tlg002.perseus-grc1:9.3
```

This example records a relationship, defined by the SAWS ontology, between a passage of text identified by a CTS URN, and a variant passage of text in the Perseus Digital Library, and assigns the identification of the relationship to a particular editor (all using resolvable URIs).

Schematron <sch:rule context="tei:relation"> <sch:assert test="@ref or @key or @name">One of the attributes @name, @ref or @key must be supplied.</sch:assert> </sch:rule>

    - *@resp*
  - att.global.source
    - *@source*
- att.styleDef
  - *@scheme*
  - *@schemeVersion*

`@scope` where CSS is used, provides a way of defining 'pseudo-elements', that is, styling rules applicable to specific sub-portions of an element.

Status Optional

Datatype teidata.enumerated

Sample values include: **first-line** styling applies to the first line of the target element

first-letter styling applies to the first letter of the target element

before styling should be applied immediately before the content of the target element

after styling should be applied immediately after the content of the target element

`@selector` contains a selector or series of selectors specifying the elements to which the contained style description applies, expressed in the language specified in the *scheme* attribute.

Status Optional

Datatype teidata.text

```
<rendition scheme="css"
  selector="text, front, back, body, div, p, ab">
display: block;
</rendition>
<rendition scheme="css"
  selector="*[rend*=italic]"> font-style: italic;
</rendition>
```

Note Since the default value of the *scheme* attribute is assumed to be CSS, the default expectation for this attribute, in the absence of *scheme*, is that CSS selector syntax will be used.

While *rendition* is used to point from an element in the transcribed source to a <rendition> element in the header which describes how it appears, the *selector* attribute allows the encoder to point in the other direction: from a <rendition> in the header to a collection of elements which all share the same renditional features. In both cases, the intention is to record the appearance of the source text, not to prescribe any particular output rendering.

Note The attribute *ref*, inherited from the class `att.canonical` may be used to indicate the kind of responsibility in a normalized form by referring directly to a standardized list of responsibility types, such as that maintained by a naming authority, for example the list maintained at `http://www.loc.gov/marc/relators/relacode.html` for bibliographic usage.

Example

```
<respStmt>
  <resp  ref="http://id.loc.gov/vocabulary/relators/com.html">compiler</resp>
  <name>Edward Child</name>
</respStmt>
```

Content model

`@locus` indicates the specific aspect of the encoding (markup or content) for which responsibility is being assigned.
Status Required
Datatype 1–∞ occurrences of teidata.enumerated separated by whitespace
Legal values are: **name** responsibility is being assigned concerning the name of the element or attribute used.
start responsibility is being assigned concerning the start of the element concerned.
end responsibility is being assigned concerning the end of the element concerned.
location responsibility is being assigned concerning the location of the element concerned.
value responsibility is being assigned concerning the content (for an element) or the value (for an attribute)

certainty: certainty precision respons

core: desc

Note The <respons> element is designed for cases in which fine-grained information about specific aspects of the markup of a text is desirable for whatever reason. Global responsibility for certain aspects of markup is usually more simply indicated in the TEI header, using the <respStmt> element within the title statement, edition statement, or change log.

Example

```
<respons target="#p1" locus="name location"
  resp="#encoder1"/>
<respons target="#p2" match="@rend"
  locus="value" resp="#encoder2"/>
<list type="encoders">
  <item xml:id="encoder1"/>
  <item xml:id="encoder2"/>
</list>
```

Example In this (partially fictional) example the entire document was transcribed and encoded by a single encoder, except for one passage which was transcribed and encoded by the proofreader.

```
<!-- in the <teiHeader>: --><respStmt xml:id="enc01">
  <name>C. Colin Backslash</name>
  <resp>transcription</resp>
  <resp>encoding</resp>
</respStmt>
<respStmt xml:id="prf01">
  <name>Erin Spelling</name>
  <resp>proofreading</resp>
</respStmt>
<!-- in the <text>: -->
<p>θερινὴ τροπή
<lb/>
  <foreign xml:lang="hbo" xml:id="mp0a8">
  <supplied reason="undefined">□□</supplied>
    <unclear/>□<unclear>
     □ □□□□
  </foreign>
</p>
<!-- elsewhere: -->
```

```
<respons  target="#mp0a8"  locus="name value"
  resp="#prf01"/>
```

Example In this (partially fictional) example an initial encoder (‘across.dta’) encoded most of the document; a later encoder (‘rcapolung.ewo’) encoded a particular passage; and a third encoder (‘sbauman.emt’) fixed some of that encoding.

```
<!-- in the <teiHeader>: --><respStmt  xml:id="enc03">
  <persName  ref="../contextual/persons.xml#across.dta"/>
  <resp>encoding</resp>
</respStmt>
<!-- in the <text>: -->

<respStmt> (statement of responsibility) supplies a statement of responsibility for the intellectual content of a text, edition, recording, or series, where the specialized elements for authors, editors, etc. do not suffice or do not apply. May also be used to encode information about individuals or organizations which have played a role in the production or distribution of a bibliographic work. [*3.12.2.2. Titles, Authors, and Editors 2.2.1. The Title Statement 2.2.2. The Edition Statement 2.2.5. The Series Statement*]

character data

Note Multiple retraces are indicated by nesting one <retrace> within another. In principle, a retrace differs from a substitution in that second and subsequent rewrites do not materially alter the content of an element. Where minor changes have been made during the retracing action however these may be marked up using <del>, <add>, etc. with an appropriate value for the *change* attribute.

Content model

```
<content>
 <macroRef key="macro.paraContent"/>
</content>
```

Schema Declaration

```

  - *@status*

Contained by *header:* teiHeader
linking: annotation
May contain
core: list
header: change listChange
Note If present on this element, the *status* attribute should indicate the current status of the document. The same attribute may appear on any <change> to record the status at the time of that change. Conventionally <change> elements should be given in reverse date order, with the most recent change at the start of the list.

Example

```
<revisionDesc status="embargoed">
  <change when="1991-11-11" who="#LB"> deleted chapter 10 </change>
</revisionDesc>
```

Content model

```
<content>
 <alternate>

`@label` provides a label (usually a single letter) to identify which part of a rhyme scheme this rhyming string instantiates.
Status Recommended
Datatype teidata.word
Note Within a particular scope, all <rhyme> elements with the same value for their *label* attribute are assumed to rhyme with each other. The scope is defined by the nearest ancestor element for which the *rhyme* attribute has been supplied.

character data

Note A <roleName> may be distinguished from an <addName> by virtue of the fact that, like a title, it typically exists independently of its holder.

Example

```
<persName>
  <forename>William</forename>
  <surname>Poulteny</surname>
  <roleName>Earl of Bath</roleName>
</persName>
```

Example

```
<p>The <roleName  role="solicitor_general">S.G.</roleName> is the only national
public official,
including the Supreme Court justices, required by statute to be “learned in the
law.”</p>
```

Example

```
<p>
  <persName  ref="#NJF">
    <roleName  role="solicitor_general">Solicitor General</roleName> Noel J.
Francisco</persName>,
representing the administration, asserted in rebuttal that there was nothing to
disavow (...)
<persName  ref="#NJF">Francisco</persName> had violated the scrupulous standard
of candor about the facts and
the law that <roleName  role="solicitor_general">S.G.s</roleName>, in
Republican and Democratic administrations
alike, have repeatedly said they must honor.
</p>
```

Content model

```
<content>
 <macroRef key="macro.phraseSeq"/>
</content>
```

`@value` identifies the root node of the network by pointing to a feature structure or other analytic element.

Status Optional

Datatype teidata.pointer

`@children` identifies the elements which are the children of the root node.

Status Required

Datatype 1–∞ occurrences of teidata.pointer separated by whitespace

Note If the root has no children (i.e., the tree is 'trivial'), then the *children* attribute should be omitted.

`@ord` (ordered) indicates whether or not the root is ordered.

Status Optional

Datatype teidata.xTruthValue

Note The value true indicates that the children of the root are ordered, whereas false indicates the are unordered.

Use if and only if *ord* is specified as partial on the <tree> element and the root has more than one child.

`@outDegree` gives the out degree of the root, the number of its children.

Status Optional

Datatype teidata.count

Note The in degree of the root is always 0.

Contained by tree

May contain

core: label

Example

```
<root  xml:id="vp1"  children="#vb1 #pn1"
  outDegree="2">
  <label>VP</label>
</root>
<leaf  xml:id="vb1"/>
<leaf  xml:id="pn1"/>

`@target` supplies a pointer to the base being glossed by this ruby text.

Status Optional

Datatype teidata.pointer

Schematron Enforce that *either target* or both *from* and *to* (or none) are used, but not *target* in combination with either *from* or *to*. <sch:rule context="tei:rt/@target"> <sch:report test="../@from | ../@to">When @target is present, neither @from nor @to should be.</sch:report> </sch:rule>

Note Should point to a single <rb> or an element that is inside an <rb>. To refer to multiple elements or text nodes at once use *from* and *to*.

`@from` points to the starting point of the span of text being glossed by this ruby text.

Status Optional

Datatype teidata.pointer

Schematron Enforce the presence of *to* iff there is a *from*. <sch:rule context="tei:rt/@from"> <sch:assert test="../@to">When @from is present, the @to attribute of «sch:name/» is required.</sch:assert> </sch:rule>

`@to` points to the ending point of the span of text being glossed.

Status Optional

Datatype teidata.pointer

Schematron Enforce the presence of *from* iff there is a *to*. <sch:rule context="tei:rt/@to"> <sch:assert test="../@from">When @to is present, the @from attribute of «sch:name/» is required.</sch:assert> </sch:rule>

character data

Note Where the *place* attribute is not provided on the <rt> element, the default assumption is that the ruby gloss is above where the text is horizontal, and to the right of the text where it is vertical.

Example The word □□□ *daitōryō* (president) is glossed character by character in hiragana to provide a pronunciation guide.

```
<p  style="writing-mode: vertical-rl"
  xml:lang="ja">
<!--…-->
  <ruby>
    <rb>大</rb>
    <rt  place="right">だい</rt>
  </ruby>
  <ruby>
    <rb>統</rb>
    <rt  place="right">とう</rt>
  </ruby>
  <ruby>
    <rb>領</rb>
    <rt  place="right">りょう</rt>
  </ruby>
<!--…-->

<rubric>

<rubric> (rubric) contains the text of any *rubric* or heading attached to a particular manuscript item, that is, a string of words through which a manuscript or other object signals the beginning of a text division, often with an assertion as to its author and title, which is in some way set off from the text itself, typically in red ink, or by use of different size or type of script, or some other such visual device. [*11.6.1. The msItem and msItemStruct Elements*]

character data

Note The <s> element may be used to mark orthographic sentences, or any other segmentation of a text, provided that the segmentation is end-to-end, complete, and non-nesting. For segmentation which is partial or recursive, the <seg> should be used instead.

The *type* attribute may be used to indicate the type of segmentation intended, according to any convenient typology.

Example

```
<head>
  <s>A short affair</s>
</head>
<s>When are you leaving?</s>
<s>Tomorrow.</s>
```

Schematron <sch:rule context="tei:s"> <sch:report test="tei:s">You may not nest one <s> element within another: use <seg> instead.</sch:report> </sch:rule>

`@aloud` may be used to indicate whether the quoted matter is regarded as having been vocalized or signed.

Status Optional

Datatype teidata.xTruthValue

```
<p> Celia thought privately, <said  aloud="false">Dorothea quite
despises Sir James Chettam;
    I believe she would not accept him.</said> Celia felt that
this was a pity.

<!-- ... -->
</p>
```

Note The value true indicates the encoded passage was expressed outwardly (whether spoken, signed, sung, screamed, chanted, etc.); the value false indicates that the encoded passage was thought, but not outwardly expressed.

`@direct` may be used to indicate whether the quoted matter is regarded as direct or indirect speech.

Status Optional

Datatype teidata.xTruthValue

Default true

```
<!-- in the header --><editorialDecl>
  <quotation  marks="none"/>
</editorialDecl>
<!-- ... -->
<p>Tantripp had brought a card, and said that
<said  direct="false">there was a gentleman waiting in the
lobby</said>.
The courier had told him that <said  direct="false">only Mrs.
Casaubon was at home</said>,
but he said <said  direct="false">he was a relation of Mr.
Casaubon's: would she see him?</said>
</p>
```

Note The value true indicates the speech or thought is represented directly; the value false that speech or thought is represented indirectly, e.g. by use of a marked verbal aspect.

  - *@ns*

`@start` specifies entry points to the schema, i.e. which patterns may be used as the root of documents conforming to it.
Status Optional
Datatype 1–∞ occurrences of teidata.name separated by whitespace
Default TEI

`@prefix` specifies a default prefix which will be prepended to all patterns relating to TEI elements, unless otherwise stated.
Status Optional
Datatype 0–1 occurrences of teidata.xmlName separated by whitespace
Note Use of this attribute allows an external schema which has an element with the same local name as a TEI element to be mixed in.

`@targetLang` (target language) specifies which language to use when creating the objects in a schema if names for elements or attributes are available in more than one language.

Status Optional

Datatype teidata.language

`@docLang` (documentation language) specifies which languages to use when creating documentation if the description for an element, attribute, class or macro is available in more than one language.

Status Optional

Datatype 1–∞ occurrences of teidata.language separated by whitespace

Note Although multiple languages may be specified, the current TEI ODD processor is only capable of handling one.

`@defaultExceptions` (default namespace exclusions) provides a list of namespaces and/or prefixed element names to be excluded by default from anyName in RELAX NG schemas.

Status Recommended

Datatype 1–∞ occurrences of teidata.namespaceOrName separated by whitespace

Default http://www.tei-c.org/ns/1.0 teix:egXML

Note Specifies defaults for the *except* attribute of <anyElement>. RELAX NG validation (unless DTD Compatibility Mode is turned off) requires that any elements which may take an *xml:id* be excluded from the content of `anyName` name classes. For normal TEI purposes, this includes anything in the TEI namespace and the <egXML> element. The *defaultExceptions* attribute sets the global defaults for these exclusions. Element prefixes must be declared using a namespace declaration on the parent or an ancestor element.

Member of model.encodingDescPart model.frontPart

Contained by

header: encodingDesc

textstructure: back body div div1 div2 div3 div4 div5 div6 div7 front

May contain

core: desc gloss

tagdocs: classRef classSpec constraintDecl constraintSpec dataRef dataSpec elementRef elementSpec equiv listRef macroRef macroSpec moduleRef moduleSpec outputRendition specGrp specGrpRef

Note A <schemaSpec> combines references to modules, individual element or macro declarations, and specification groups together to form a unified schema.

The processing of the <schemaSpec> element must resolve any conflicts amongst the declarations it either contains or refers to. Different ODD processors may generate schemas and documentation using different concrete syntaxes.

The source may be specified (on the *source* attribute) in the form of a private URI, for which the recommended format is `tei:x.y.z`, where `x.y.z` indicates the version number, e.g. `tei:1.5.1` for 1.5.1 release of TEI P5 or (as a special case) `tei:current` for whatever is the latest release. The source indicated must provide a set of TEI-conformant specifications in a form directly usable by an ODD processor. By default, this will be the location of the current release of the TEI Guidelines.

Example

```
<schemaSpec prefix="TEI_" ident="testsvg"
  start="TEI svg">
  <moduleRef source="tei:current"
    key="header"/>
  <moduleRef key="core"/>
  <moduleRef key="drama"/>
  <moduleRef url="svg11.rng"/>
</schemaSpec>
```

This schema combines elements from the current versions of the drama and core modules, the current

release version of the header module, and elements from an existing RELAX NG schema available from the URL indicated.

Example

```
<schemaSpec ident="Bare-plus"
  source="tei_bare.compiled.odd" start="TEI">
  <moduleRef key="tei"/>
  <moduleRef key="header"/>
  <elementRef key="q" source="tei:3.0.0"/>
  <moduleRef key="textstructure"/>
</schemaSpec>
```

This schema starts with a pre-existing customization of the TEI called TEI Bare (a customization with a minimal selection of elements). The <q> element is not available in TEI Bare, but it can be brought back. In this case, we will get the version defined in TEI P5 release 3.0.0

Content model

```
<content>
 <sequence>
  <alternate minOccurs="0"
   maxOccurs="unbounded">
   <classRef key="model.identEquiv"/>

character data

Note The <seg> element may be used at the encoder's discretion to mark any segments of the text of interest for processing. One use of the element is to mark text features for which no appropriate markup is otherwise defined. Another use is to provide an identifier for some segment which is to be pointed at by some other element—i.e. to provide a target, or a part of a target, for a <ptr> or other similar element.

Example

```
<seg>When are you leaving?</seg>
<seg>Tomorrow.</seg>
```

Example

```
<s>
  <seg  rend="caps"  type="initial-cap">So father's only</seg> glory was the
ballfield.
</s>
```

Example

```
<seg  type="preamble">
  <seg>Sigmund, <seg  type="patronym">the son of Volsung</seg>, was a king in
Frankish country.</seg>
  <seg>Sinfiotli was the eldest of his sons ...</seg>
  <seg>Borghild, Sigmund's wife, had a brother ... </seg>
</seg>

Note As with other culturally-constructed traits such as age and gender, the way in which this concept is described in different cultural contexts varies. The normalizing attributes are provided only as an

optional means of simplifying that variety for purposes of interoperability or project-internal taxonomies for consistency, and should not be used where that is inappropriate or unhelpful. The content of the element may be used to describe the intended concept in more detail.

Example

```
<sex value="F">female</sex>
```

  - *@who*
- att.cmc
  - *@generatedBy*

`@feature` a paralinguistic feature.

Status Optional

Datatype teidata.enumerated

Suggested values include: **tempo** speed of utterance.

loud loudness.

pitch pitch range.

tension tension or stress pattern.

rhythm rhythmic qualities.

voice voice quality.

`@new` specifies the new state of the paralinguistic feature specified.

Status Recommended

Datatype teidata.enumerated

Default normal

Note Some possible values for this attribute are provided in section *8.4.2. Synchronization and Overlap.* The special value normal should be used to indicate that the feature concerned ceases to be remarkable at this point. In earlier versions of these

Guidelines, a null value for this attribute was understood to have the same effect: this practice is now deprecated and will be removed at a future release.

verse: metSym rhyme

May contain Empty element

Example

```
<u  who="#LB">
  <shift  feature="loud"  new="f"/>Elizabeth
</u>
<u  who="#EB">Yes</u>
<u  who="#LB">
  <shift  feature="loud"  new="normal"/>Come and try this
<pause/>
  <shift  feature="loud"  new="ff"/>come on
</u>
<!-- ... -->
```

```
<listPerson type="speakers">
  <person xml:id="LB"/>
  <person xml:id="EB"/>
</listPerson>
```

The word ‘Elizabeth’ is spoken loudly, the words ‘Yes’ and ‘Come and try this’ with normal volume, and the words ‘come on’ very loudly.

Schematron <sch:rule context="tei:shift"> <sch:assert test="@new" role="warning"> The @new attribute should always be supplied; use the special value "normal" to indicate that the feature concerned ceases to be remarkable at this point. </sch:assert> </sch:rule>

Content model `<content> <empty/></content>`

Schema Declaration

character data

Example

```
for his nose was as sharp as
a pen, and <sic>a Table</sic> of green fields.
```

Example If all that is desired is to call attention to the apparent problem in the copy text, <sic> may be used alone:

```
I don't know, Juan. It's so far in the past now
— how <sic>we can</sic> prove or disprove anyone's theories?
```

Example It is also possible, using the <choice> and <corr> elements, to provide a corrected reading:

```
I don't know, Juan. It's so far in the past now
— how <choice>
  <sic>we can</sic>
  <corr>can we</corr>
</choice> prove or disprove anyone's theories?
```

Example

```
for his nose was as sharp as
a pen, and <choice>
  <sic>a Table</sic>
  <corr>a' babbld</corr>
</choice> of green fields.
```

Content model

`@type` characterizes the element in some sense, using any convenient classification scheme or typology.
Derived from att.typed
Status Optional
Datatype teidata.enumerated
Sample values include: **atBirth**
atDeath
dependent
inherited
independent

`@scheme` identifies the classification system or taxonomy in use, for example by pointing to a locally-defined <taxonomy> element or by supplying a URI for an externally-defined system.
Status Optional
Datatype teidata.pointer

`@code` identifies a status code defined within the classification system or taxonomy defined by the *scheme* attribute.
Status Optional
Datatype teidata.pointer

- att.typed
  - ~~type~~
  - @subtype

`@type` categorizes the sound in some respect, e.g. as music, special effect, etc.
Derived from att.typed
Status Optional
Datatype teidata.enumerated

`@discrete` indicates whether the sound overlaps the surrounding speeches or interrupts them.
Status Optional
Datatype teidata.xTruthValue
Note The value true indicates that the sound is heard between the surrounding speeches; the value false indicates that the sound overlaps one or more of the surrounding speeches.

`@resp` (responsible party) (responsible party) indicates the individual responsible for identifying and measuring the space.
Derived from att.global.responsibility
Status Optional
Datatype 1–∞ occurrences of teidata.pointer separated by whitespace

`@dim` (dimension) indicates whether the space is horizontal or vertical.
Status Recommended
Datatype teidata.enumerated
Legal values are: **horizontal** the space is horizontal.
vertical the space is vertical.
Note For irregular shapes in two dimensions, the value for this attribute should reflect the more important of the two dimensions. In conventional left-right scripts, a space with both vertical and horizontal components should be classed as vertical.

`@from` gives the identifier of the node which is the starting point of the span of text being annotated; if not accompanied by a *to* attribute, gives the identifier of the node of the entire span of text being annotated.
Status Optional
Datatype teidata.pointer

`@to` gives the identifier of the node which is the end-point of the span of text being annotated.
Status Optional
Datatype teidata.pointer

character data

Note This element may be used to transcribe which character is speaking in a dramatic text as indicated by the source text; the *who* attribute of an <sp> element may be used to point to another element (typically a <role>) which provides information about the character speaking. Either or both may be used.

Example

```
<sp  who="#ni #rsa">
  <speaker>Nancy and Robert</speaker>
  <stage  type="delivery">(speaking simultaneously)</stage>
  <p>The future? ...</p>
</sp>
<list  type="speakers">
  <item  xml:id="ni"/>
  <item  xml:id="rsa"/>
</list>
```

Content model

```
<content>
 <macroRef key="macro.phraseSeq"/>
</content>
```

Schema Declaration

```
element speaker
{
   att.global.attributes,
   att.global.analytic.attributes,
   att.global.change.attributes,
   att.global.facs.attributes,
   att.global.linking.attributes,
   att.global.rendition.attributes,
```

```
   att.global.responsibility.attributes,
   att.global.source.attributes,
   att.placement.attributes,
   att.written.attributes,
   macro.phraseSeq}
```

<specDesc> (specification description) indicates that a description of the specified element, class, or macro should be included at this point within a document. [*23.1.2. Element and Attribute Descriptions*]

`@key` (identifier) supplies the identifier of the documentary element or class for which a description is to be obtained.

Status Required

Datatype teidata.name

```
<specDesc key="emph"/>
```

Note The value should match the *ident* of a documentary element (that is, a member of att.identified).

`@atts` (attributes) supplies attribute names for which descriptions should additionally be obtained.

Status Recommended

Datatype 0–∞ occurrences of teidata.name separated by whitespace

```
<specDesc key="foreign"
  atts="usage xml:lang"/>
```

Note The attribute names listed may include both attributes inherited from a class and those defined explicitly for the associated element.

May contain Empty element

Note The description is usually displayed as a label and an item. The list of attributes may include some which are inherited by virtue of an element's class membership; descriptions for such attributes may also be retrieved using another <specDesc>, this time pointing at the relevant class.

Example

```
<specDesc key="orth"/>
```

Example

```
<specDesc key="emph"/>
```

Example

```
<specDesc key="foreign"
  atts="usage xml:lang"/>
```

Content model `<content> <empty/></content>`

Schema Declaration

```
element specDesc
{
   att.global.attributes,
   att.global.analytic.attributes,
   att.global.change.attributes,
   att.global.facs.attributes,
   att.global.linking.attributes,
   att.global.rendition.attributes,
   att.global.responsibility.attributes,
   att.global.source.attributes,
   attribute key { text },
   attribute atts { list { * } }?,
   empty
}
```

<specGrp>

<specGrp> (specification group) contains any convenient grouping of specifications for use within the current module. [*23.2. Modules and Schemas*]

tagdocs: classRef classSpec constraintSpec dataRef dataSpec elementRef elementSpec listRef macroRef macroSpec moduleRef moduleSpec outputRendition specGrp specGrpRef

Note A specification group is referenced by means of its *xml:id* attribute. The declarations it contains may be included in a <schemaSpec> or <moduleSpec> element only by reference (using a <specGrpRef> element): it may not be nested within a <moduleSpec> element.

Different ODD processors may generate representations of the specifications contained by a <specGrp> in different concrete syntaxes.

Example

```
<specGrp xml:id="xDAILC">
  <elementSpec ident="s">
<!-- ... -->
  </elementSpec>
  <elementSpec ident="cl">
<!-- ... -->
  </elementSpec>
  <elementSpec ident="w">
<!-- ... -->
  </elementSpec>
  <elementSpec ident="m">
<!-- ... -->
  </elementSpec>
  <elementSpec ident="c">
<!-- ... -->
  </elementSpec>
</specGrp>
```

This specification group with identifier `xDAILC` contains specifications for the elements <s>,<cl>,<w>, etc.

Content model

```
<content>
 <alternate minOccurs="0"
  maxOccurs="unbounded">
  <classRef key="model.oddDecl"/>
  <classRef key="model.oddRef"/>
  <classRef key="model.divPart"/>
  <elementRef key="listRef"/>
 </alternate>
</content>
```

Schema Declaration

```
element specGrp
{
   att.global.attributes,
   att.global.analytic.attributes,
   att.global.change.attributes,
   att.global.facs.attributes,
   att.global.linking.attributes,
   att.global.rendition.attributes,
   att.global.responsibility.attributes,
   att.global.source.attributes,
   ( model.oddDecl | model.oddRef | model.divPart | listRef )*
}
```

<specGrpRef> (reference to a specification group) indicates that the declarations contained by the <specGrp> referenced should be inserted at this point. [*23.2. Modules and Schemas*]

May contain Empty element

Note In ODD documentation processing, a <specGrpRef> usually produces a comment indicating that a set of declarations printed in another section will be inserted at this point in the <specGrp> being discussed. In schema processing, the contents of the specified <specGrp> are made available for inclusion in the generated schema.

The specification group identified by the *target* attribute will normally be part of the current ODD document.

Example

```
<p>This part of the module contains declarations for names of persons, places,
and
organisations: <specGrpRef  target="#names.pers"/>
  <specGrpRef  target="#names.place"/>
  <specGrpRef  target="#names.org"/>
</p>
<!-- elsewhere -->
<specGrp  xml:id="names.pers">
<!--... -->
</specGrp>
<!-- elsewhere -->
<specGrp  xml:id="names.place">
<!--... -->
</specGrp>
<!-- elsewhere -->
<specGrp  xml:id="names.org">
<!--... -->
</specGrp>
```

Content model `<content> <empty/></content>`

Schema Declaration

```
element specGrpRef
{
   att.global.attributes,
   att.global.analytic.attributes,
   att.global.change.attributes,
   att.global.facs.attributes,
   att.global.linking.attributes,
   att.global.rendition.attributes,
   att.global.responsibility.attributes,
   att.global.source.attributes,
   attribute target { text },
```

```
   empty
}
```

<specList> (specification list) marks where a list of descriptions is to be inserted into the prose documentation. [*23.1.2. Element and Attribute Descriptions*]

    so luxurious.</p>
</sp>
<stage>(She sings)</stage>
<spGrp  n="4">
  <sp>
    <l>If you bought me diamonds, If you bought me pearls,</l>
    <l>If you bought me roses like some other gents</l>
    <l>Might bring to other girls,</l>
    <l>It couldn't please me more</l>
    <l>Than the gift I see -</l>
    <stage>(She takes a large pineapple out of the bag)</stage>
    <l>A pineapple for me!</l>
  </sp>
  <sp>
    <speaker>SCHULTZ:</speaker>
    <stage>(Singing)</stage>
    <l>If, in your emotion,</l>
    <l>You began to sway,</l>
    <l>Went to get some air,</l>
    <l>Or grabbed a chair</l>
    <l>To keep from fainting dead away,</l>
    <l>It couldn't please me more</l>
    <l>Than to see you cling</l>
    <l>To the pineapple I bring.</l>
  </sp>
  <sp>
    <speaker>BOTH:</speaker>
    <l>Ah, ah, ah, ah, ah, ah, ah, ah</l>
  </sp>
<!-- ... -->
  <stage>(They dance)</stage>
</spGrp>
<sp>
  <speaker>FRAULEIN SCHNEIDER:</speaker>
  <p>But you must not bring me
     any more pineapples! Do you hear? It is not proper. It is a gift a
     young man would present to his lady love. It makes me blush!
  </p>
</sp>

`@type` indicates the kind of stage direction.

Status Recommended

Datatype 1–∞ occurrences of teidata.enumerated separated by whitespace

Suggested values include: **setting** describes a setting.

entrance describes an entrance.

exit describes an exit.

business describes stage business.

novelistic is a narrative, motivating stage direction.

delivery describes how a character speaks.

modifier gives some detail about a character.

location describes a location.

mixed more than one of the above

Note If the value mixed is used, it must be the only value. Multiple values may however be supplied if a single stage direction performs multiple functions, for example is both an entrance and a modifier.

character data

Note The *who* attribute may be used to indicate more precisely the person or persons participating in the action described by the stage direction.

Example

```
<stage type="setting">A curtain being drawn.</stage>
<stage type="setting">Music</stage>
<stage type="entrance">Enter Husband as being thrown off his horse and
falls.</stage>
<!-- Middleton : Yorkshire Tragedy -->
<stage type="exit">Exit pursued by a bear.</stage>
<stage type="business">He quickly takes the stone out.</stage>
<stage type="delivery">To Lussurioso.</stage>
<stage type="novelistic">Having had enough, and embarrassed for the
family.</stage>
<!-- Lorraine Hansbury : a raisin in in the sun -->
<stage type="modifier">Disguised as Ansaldo.</stage>
<stage type="entrance modifier">Enter Latrocinio disguised as an
empiric</stage>
<!-- Middleton: The Widow -->
<stage type="location">At a window.</stage>
<stage rend="inline" type="delivery">Aside.</stage>
```

Example

```
<l>Behold. <stage n="*" place="margin">Here the vp<lb/>per part of the
<hi>Scene</hi> open'd; when
    straight appear'd a Heauen, and all the <hi>Pure Artes</hi> sitting on
    two semi<lb/>circular ben<lb/>ches, one a<lb/>boue another: who sate thus
till the rest of the
  <hi>Prologue</hi> was spoken, which being ended, they descended in
    order within the <hi>Scene,</hi> whiles the Musicke plaid</stage> Our
Poet knowing our free hearts</l>

msdescription: msDesc

namesdates: state

Note Where there is confusion between <trait> and <state> the more general purpose element <state> should be used even for unchanging characteristics. If you wish to distinguish between characteristics that are generally perceived to be time-bound states and those assumed to be fixed traits, then <trait> is available for the more static of these. The <state> element encodes characteristics which are sometimes assumed to change, often at specific times or over a date range, whereas the <trait> elements are used to record characteristics, such as eye-colour, which are less subject to change. Traits are typically, but not necessarily, independent of the volition or action of the holder.

Example

```
<state ref="#SCHOL" type="status">
  <label>scholar</label>
</state>
```

Example

```
<org>
  <orgName notAfter="1960">The Silver Beetles</orgName>
  <orgName notBefore="1960">The Beatles</orgName>
  <state type="membership" from="1960-08"

character data

Note The order and presentation of house names and numbers and street names, etc., may vary considerably in different countries. The encoding should reflect the order which is appropriate in the country concerned.

Example

```
<street>via della Faggiola, 36</street>
```

Example

```
<street>
  <name>Duntaggin</name>, 110 Southmoor Road
</street>
```

Content model

`@attachment` describes the method by which this surface is or was connected to the main surface.
Status Optional
Datatype teidata.enumerated
Sample values include: **glued** glued in place
pinned pinned or stapled in place
sewn sewn in place

`@flipping` indicates whether the surface is attached and folded in such a way as to provide two writing surfaces.
Status Optional
Datatype teidata.truthValue

Note The <surface> element represents any two-dimensional or three-dimensional space on some physical surface forming part of the source material, such as a piece of paper, a face of a monument, a billboard, a scroll, a leaf etc.

The coordinate space defined by this element may be thought of as a grid *lrx* - *ulx* units wide and *uly* - *lry* units high.

The <surface> element may contain graphic representations or transcriptions of written zones, or both. The coordinate values used by every <zone> element contained by this element are to be understood with reference to the same grid.

Where it is useful or meaningful to do so, any grouping of multiple <surface> elements may be indicated using the <surfaceGrp> element.

Example

```
<facsimile>
  <surface ulx="0" uly="0" lrx="200" lry="300">
    <graphic url="Bovelles-49r.png"/>
  </surface>
</facsimile>
```

Content model

   )
}
```

<surfaceGrp> (surface group) defines any kind of useful grouping of written surfaces, for example the recto and verso of a single leaf, which the encoder wishes to treat as a single unit. [*12.1. Digital Facsimiles*]

• att.typed
- ~~type~~
- @subtype

`@type` indicates the type of XML tag intended.
Derived from att.typed
Status Optional
Datatype teidata.enumerated
Legal values are: **start** a start-tag, with delimiters < and > is intended
end an end-tag, with delimiters </ and > is intended
empty an empty tag, with delimiters < and /> is intended
pi a pi (processing instruction), with delimiters <? and ?> is intended
comment a comment, with delimiters <!– and –> is intended
ms a marked-section, with delimiters <[CDATA[and]]> is intended

`@scheme` supplies the name of the schema in which this tag is defined.
Status Optional
Datatype teidata.enumerated
Sample values include: **TEI** (text encoding initiative) This tag is defined as part of the TEI scheme.[Default]
DBK (docbook) this tag is part of the Docbook scheme.
XX (unknown) this tag is part of an unknown scheme.

  * *@cert*
  * *@resp*
- – att.global.source
  * *@source*

`@partial` indicates whether the element types listed exhaustively include all those found within <text>, or represent only a subset.
Status Recommended
Datatype teidata.truthValue
Note TEI recommended practice is to specify this attribute. When the <tagUsage> elements inside <tagsDecl> are used to list each of the element types in the associated <text>, the value should be given as false. When the <tagUsage> elements inside <tagsDecl> are used to provide usage information or default renditions for only a subset of the elements types within the associated <text>, the value should be true.

Member of model.encodingDescPart
Contained by
header: encodingDesc
May contain

header: namespace rendition
Example

```
<tagsDecl partial="true">
  <rendition xml:id="rend-it" scheme="css"
    selector="emph, hi, name, title">font-style: italic;</rendition>
  <namespace name="http://www.tei-c.org/ns/1.0">
    <tagUsage gi="hi" occurs="467"/>
    <tagUsage gi="title" occurs="45"/>
  </namespace>
  <namespace name="http://docbook.org/ns/docbook">
    <tagUsage gi="para" occurs="10"/>
  </namespace>
</tagsDecl>
```

If the *partial* attribute were not specified here, the implication would be that the document in question contains only <hi>, <title>, and <para> elements.

Content model

```
<content>
 <sequence>
  <elementRef key="rendition" minOccurs="0"
   maxOccurs="unbounded"/>
  <elementRef key="namespace" minOccurs="0"
   maxOccurs="unbounded"/>
 </sequence>
</content>
```

Schema Declaration

```

`@gi` (generic identifier) specifies the name (generic identifier) of the element indicated by the tag, within the namespace indicated by the parent <namespace> element.
Status Required
Datatype teidata.name

`@occurs` specifies the number of occurrences of this element within the text.
Status Recommended
Datatype teidata.count

`@withId` (with unique identifier) specifies the number of occurrences of this element within the text which bear a distinct value for the global *xml:id* attribute.
Status Recommended
Datatype teidata.count

<TEI> (TEI document) contains a single TEI-conformant document, combining a single TEI header with one or more members of the `model.resource` class. Multiple <TEI> elements may be combined within a <TEI> (or <teiCorpus>) element. [*4. Default Text Structure 16.1. Varieties of Composite Text*]

`@version` specifies the version number of the TEI Guidelines against which this document is valid.

Status Optional

Datatype teidata.version

Note Major editions of the Guidelines have long been informally referred to by a name made up of the letter P (for Proposal) followed by a digit. The current release is one of the many releases of the fifth major edition of the Guidelines, known as P5. This attribute may be used to associate a TEI document with a specific release of the P5 Guidelines, in the absence of a more precise association provided by the *source* attribute on the associated <schemaSpec>.

Member of model.describedResource

Contained by

core: teiCorpus

textstructure: TEI

May contain

header: teiHeader

iso-fs: fsdDecl

linking: standOff

textstructure: TEI text

transcr: facsimile sourceDoc

Note As with all elements in the TEI scheme (except <egXML>) this element is in the TEI namespace (see *v.7.2 Namespaces*). Thus, when it is used as the outermost element of a TEI document, it is necessary to specify the TEI namespace on it. This is customarily achieved by including `http://www.tei-c.org/ns/1.0` as the value of the XML namespace declaration (xmlns), without indicating a prefix, and then not using a prefix on TEI elements in the rest of the document. For example: <TEI version="4.8.1" xml:lang="it" xmlns="http://www.tei-c.org/ns/1.0">.

Example

```
<TEI  version="3.3.0" xmlns="http://www.tei-c.org/ns/1.0">
  <teiHeader>
    <fileDesc>
      <titleStmt>
        <title>The shortest TEI Document Imaginable</title>
      </titleStmt>
      <publicationStmt>
        <p>First published as part of TEI P2, this is the P5
```

```
                version using a namespace.</p>
      </publicationStmt>
      <sourceDesc>
        <p>No source: this is an original work.</p>
      </sourceDesc>
    </fileDesc>
  </teiHeader>
  <text>
    <body>
      <p>This is about the shortest TEI document imaginable.</p>
    </body>
  </text>
</TEI>
```

Example

```
<TEI  version="2.9.1" xmlns="http://www.tei-c.org/ns/1.0">
  <teiHeader>
    <fileDesc>
      <titleStmt>
        <title>A TEI Document containing four page images </title>
      </titleStmt>
      <publicationStmt>
        <p>Unpublished demonstration file.</p>
      </publicationStmt>
      <sourceDesc>
        <p>No source: this is an original work.</p>
      </sourceDesc>
    </fileDesc>
  </teiHeader>
  <facsimile>
    <graphic  url="page1.png"/>
    <graphic  url="page2.png"/>
    <graphic  url="page3.png"/>
    <graphic  url="page4.png"/>
  </facsimile>
</TEI>
```

Content model

```
<content>
 <sequence>
  <elementRef key="teiHeader"/>
  <alternate>
   <sequence>
    <classRef key="model.resource"
     minOccurs="1" maxOccurs="unbounded"/>
    <elementRef key="TEI" minOccurs="0"
     maxOccurs="unbounded"/>
   </sequence>
   <elementRef key="TEI" minOccurs="1"
    maxOccurs="unbounded"/>
  </alternate>
 </sequence>
</content>
```

Schema Declaration

```
element TEI
{
   att.global.attributes,
   att.global.analytic.attributes,
   att.global.change.attributes,
   att.global.facs.attributes,
   att.global.linking.attributes,
   att.global.rendition.attributes,
   att.global.responsibility.attributes,
   att.global.source.attributes,
   att.typed.attributes,
   attribute version { text }?,
   ( teiHeader, ( ( model.resource+, TEI* ) | TEI+ ) )
}
```

<teiCorpus> (TEI corpus) contains the whole of a TEI encoded corpus, comprising a single corpus header and one or more <TEI> elements, each containing a single text header and a text. [*4. Default Text Structure 16.1. Varieties of Composite Text*]

`@version` (version) specifies the version number of the TEI Guidelines against which this document is valid.
Status Optional
Datatype teidata.version
Note Major editions of the Guidelines have long been informally referred to by a name made up of the letter P (for Proposal) followed by a digit. The current release is one of the many releases of the fifth major edition of the Guidelines, known as P5. This attribute may be used to associate a TEI document with a specific release of the P5 Guidelines, in the absence of a more precise association provided by the *source* attribute on the associated <schemaSpec>.

Member of model.describedResource
Contained by
core: teiCorpus
May contain
core: teiCorpus
header: teiHeader
iso-fs: fsdDecl
linking: standOff
textstructure: TEI text
transcr: facsimile sourceDoc
Note Should contain one <teiHeader> for the corpus, and a series of <TEI> elements, one for each text.

As with all elements in the TEI scheme (except <egXML>) this element is in the TEI namespace (see *v.7.2 Namespaces*). Thus, when it is used as the outermost element of a TEI document, it is necessary to specify the TEI namespace on it. This is customarily achieved by including `http://www.tei-c.org/ns/1.0` as the value of the XML namespace declaration (xmlns), without indicating a prefix, and then not using a prefix on TEI elements in the rest of the document. For example: <teiCorpus version="4.8.1" xml:lang="en" xmlns="http://www.tei-c.org/ns/1.0">.
Example

```
<teiCorpus  version="3.3.0" xmlns="http://www.tei-c.org/ns/1.0">
  <teiHeader>
<!-- header for corpus -->
  </teiHeader>
  <TEI>
    <teiHeader>
<!-- header for first text -->
    </teiHeader>
    <text>
<!-- content of first text -->
    </text>
  </TEI>
  <TEI>
```

```
      <teiHeader>
   <!-- header for second text -->
      </teiHeader>
      <text>
   <!-- content of second text -->
      </text>
    </TEI>
   <!-- more TEI elements here -->
   </teiCorpus>
```

Content model

```
<content>
 <sequence>
  <elementRef key="teiHeader"/>
  <classRef key="model.resource"
   minOccurs="0" maxOccurs="unbounded"/>
  <classRef key="model.describedResource"
   minOccurs="1" maxOccurs="unbounded"/>
 </sequence>
</content>
```

Schema Declaration

```
element teiCorpus
{
   att.global.attributes,
   att.global.analytic.attributes,
   att.global.change.attributes,
   att.global.facs.attributes,
   att.global.linking.attributes,
   att.global.rendition.attributes,
   att.global.responsibility.attributes,
   att.global.source.attributes,
   att.typed.attributes,
   attribute version { text }?,
   ( teiHeader, model.resource*, model.describedResource+ )
}
```

<teiHeader>

(TEI header) supplies descriptive and declarative metadata associated with a digital resource or set of resources. [*2.1.1. The TEI Header and Its Components 16.1. Varieties of Composite Text*]

character data

Note When this element appears within an <index> element, it is understood to supply the form under which an index entry is to be made for that location. Elsewhere, it is understood simply to indicate that its

content is to be regarded as a technical or specialised term. It may be associated with a <gloss> element by means of its *ref* attribute; alternatively a <gloss> element may point to a <term> element by means of its *target* attribute.

In formal terminological work, there is frequently discussion over whether terms must be atomic or may include multi-word lexical items, symbolic designations, or phraseological units. The <term> element may be used to mark any of these. No position is taken on the philosophical issue of what a term can be; the looser definition simply allows the <term> element to be used by practitioners of any persuasion.

As with other members of the `att.canonical` class, instances of this element occuring in a text may be associated with a canonical definition, either by means of a URI (using the *ref* attribute), or by means of some system-specific code value (using the *key* attribute). Because the mutually exclusive *target* and *cRef* attributes overlap with the function of the *ref* attribute, they are deprecated and may be removed at a subsequent release.

Example

```
A computational device that infers structure
from grammatical strings of words is known as a <term>parser</term>, and much
of the history
of NLP over the last 20 years has been occupied with the design of parsers.
```

Example

```
We may define <term  xml:id="TDPV1"  rend="sc">discoursal point of view</term>
as
<gloss  target="#TDPV1">the relationship, expressed
through discourse structure, between the implied author or some other
addresser, and the
fiction.</gloss>
```

Example

```
We may define <term  ref="#TDPV2"  rend="sc">discoursal point of view</term> as

<gloss  xml:id="TDPV2">the relationship, expressed
through discourse structure, between the implied author or some other
addresser, and the
fiction.</gloss>
```

Example

```
We discuss Leech's concept of
<term  ref="myGlossary.xml#TDPV2"  rend="sc">discoursal point of view</term>
below.
```

textstructure: back body front group
transcr: addSpan damageSpan delSpan fw listTranspose metamark space substJoin

Note This element should not be used to represent a text which is inserted at an arbitrary point within the structure of another, for example as in an embedded or quoted narrative; the <floatingText> is provided for this purpose.

Example

```
<text>
  <front>
    <docTitle>
      <titlePart>Autumn Haze</titlePart>
    </docTitle>
  </front>
  <body>
    <l>Is it a dragonfly or a maple leaf</l>
    <l>That settles softly down upon the water?</l>
  </body>
</text>
```

Example The body of a text may be replaced by a group of nested texts, as in the following schematic:

```
<text>
  <front>
<!-- front matter for the whole group -->
  </front>
  <group>
    <text>
<!-- first text -->
    </text>
    <text>
<!-- second text -->
    </text>
  </group>
</text>
```

Content model

```
<content>
 <sequence>
  <classRef key="model.global"
   minOccurs="0" maxOccurs="unbounded"/>
  <sequence minOccurs="0">
   <elementRef key="front"/>
   <classRef key="model.global"
    minOccurs="0" maxOccurs="unbounded"/>
  </sequence>
  <alternate>
   <elementRef key="body"/>
```

```
   <elementRef key="group"/>
  </alternate>
  <classRef key="model.global"
   minOccurs="0" maxOccurs="unbounded"/>
  <sequence minOccurs="0">
   <elementRef key="back"/>
   <classRef key="model.global"
    minOccurs="0" maxOccurs="unbounded"/>
  </sequence>
 </sequence>
</content>
```

Schema Declaration

```
element text
{
   att.global.attributes,

character data

Note This element should not be used to document the languages or writing systems used for the bibliographic or manuscript description itself: as for all other TEI elements, such information should be provided by means of the global *xml:lang* attribute attached to the element containing the description.

In all cases, languages should be identified by means of a standardized 'language tag' generated according to BCP 47. Additional documentation for the language may be provided by a <language> element in the TEI header.

Example

```
<textLang mainLang="en" otherLangs="la"> Predominantly in English with Latin
glosses</textLang>
```

Content model

```
<content>
 <macroRef key="macro.specialPara"/>
</content>
```

Schema Declaration

```
element textLang
{
   att.global.attributes,
   att.global.analytic.attributes,
   att.global.change.attributes,
   att.global.facs.attributes,
   att.global.linking.attributes,
   att.global.rendition.attributes,
   att.global.responsibility.attributes,
   att.global.source.attributes,
   attribute mainLang { text }?,
   attribute otherLangs { list { * } }?,
   macro.specialPara}
```

<textNode> indicates the presence of a text node in a content model. [*23. Documentation Elements*]

`@origin` designates the origin of the timeline, i.e. the time at which it begins.
Status Optional
Datatype teidata.pointer
Note If this attribute is not supplied, the implication is that the time of origin is not known. If it is supplied, it must point either to one of the <when> elements in its content, or to another <timeline> element.

`@unit` specifies the unit of time corresponding to the *interval* value of the timeline or of its constituent points in time.
Status Optional
Datatype teidata.enumerated
Suggested values include: **d** (days)
h (hours)
min (minutes)
s (seconds)
ms (milliseconds)

`@interval` specifies a time interval either as a positive integral value or using one of a set of predefined codes.
Status Optional
Datatype teidata.interval
Note The value irregular indicates uncertainty about all the intervals in the timeline; the value regular indicates that all the intervals are evenly spaced, but the size of the intervals is not known; numeric values indicate evenly spaced values of the size specified. If individual points in time in the timeline are given different values for the *interval* attribute, those values locally override the value given in the timeline.

- att.typed
  - ~~type~~
  - @subtype

`@type` classifies the title according to some convenient typology.

Derived from att.typed

Status Optional

Datatype teidata.enumerated

Sample values include: **main** main title

sub (subordinate) subtitle, title of part

alt (alternate) alternate title, often in another language, by which the work is also known

short abbreviated form of title

desc (descriptive) descriptive paraphrase of the work functioning as a title

Note This attribute is provided for convenience in analysing titles and processing them according to their type; where such specialized processing is not necessary, there is no need for such analysis, and the entire title, including subtitles and any parallel titles, may be enclosed within a single <title> element.

`@level` indicates the bibliographic level for a title, that is, whether it identifies an article, book, journal, series, or unpublished material.

Status Optional

Datatype teidata.enumerated

Legal values are: **a** (analytic) the title applies to an analytic item, such as an article, poem, or other work published as part of a larger item.

m (monographic) the title applies to a monograph such as a book or other item considered to be a distinct publication, including single volumes of multi-volume works

j (journal) the title applies to any serial or periodical publication such as a journal, magazine, or newspaper

s (series) the title applies to a series of otherwise distinct publications such as a collection

u (unpublished) the title applies to any unpublished material (including theses and dissertations unless published by a commercial press)

Note The level of a title is sometimes implied by its context: for example, a title appearing directly within an <analytic> element is *ipso facto* of level 'a', and one appearing within a <series> element of level 's'. For this reason, the *level* attribute is not required in contexts where its value can be unambiguously inferred. Where it is supplied in such contexts, its value should not contradict the value implied by its parent element.

character data

Note The attributes *key* and *ref*, inherited from the class `att.canonical` may be used to indicate the canonical form for the title; the former, by supplying (for example) the identifier of a record in some

external library system; the latter by pointing to an XML element somewhere containing the canonical form of the title.

Example

```
<title>Information Technology and the Research Process: Proceedings of
a conference held at Cranfield Institute of Technology, UK,
18–21 July 1989</title>
```

Example

```
<title>Hardy's Tess of the D'Urbervilles: a machine readable
edition</title>
```

Example

```
<title  type="full">
  <title  type="main">Synthèse</title>
  <title  type="sub">an international journal for
     epistemology, methodology and history of
     science</title>
</title>
```

msdescription: msDesc

namesdates: trait

Note Where there is confusion between <trait> and <state> the more general purpose element <state> should be used even for unchanging characteristics. If you wish to distinguish between characteristics that are generally perceived to be time-bound states and those assumed to be fixed traits, then <trait> is available for the more static of these. The <state> element encodes characteristics which are sometimes assumed to change, often at specific times or over a date range, whereas the <trait> elements are used to record characteristics, such as eye-colour, which are less subject to change. Traits are typically, but not necessarily, independent of the volition or action of the holder.

Example

```
<trait type="physical">
  <label>Eye colour</label>
  <desc>Blue</desc>
</trait>
```

* *@rend*
* *@style*
* *@rendition*

– att.global.responsibility
* *@cert*
* *@resp*

– att.global.source
* *@source*

Contained by: tei_descr: listTranspose

May contain

core: ptr

Note Transposition is usually indicated in a document by a metamark such as a wavy line or numbering.

The order in which <ptr> elements appear within a <transpose> element should correspond with the desired order, as indicated by the metamark.

Example

```
<transpose>
  <ptr  target="#ib02"/>
  <ptr  target="#ib01"/>
</transpose>
```

The transposition recorded here indicates that the content of the element with identifier `ib02` should appear before the content of the element with identifier `ib01`.

Content model

```
<content>
 <elementRef key="ptr" minOccurs="2"
  maxOccurs="unbounded"/>
</content>
```

    - *@resp*
  - att.global.source

* *@source*

`@arity` gives the maximum number of children of the root and internal nodes of the tree.
Status Optional
Datatype teidata.count

`@ord` (ordered) indicates whether or not the tree is ordered, or if it is partially ordered.
Status Required
Datatype teidata.enumerated
Legal values are: **true** indicates that all of the branching nodes of the tree are ordered.
partial indicates that some of the branching nodes of the tree are ordered and some are unordered.
false indicates that all of the branching nodes of the tree are unordered.

`@order` gives the order of the tree, i.e., the number of its nodes.
Status Optional
Datatype teidata.count
Note The size of a tree is always one less than its order, hence there is no need for both a *size* and *order* attribute.

`@trans` (transition) indicates the nature of the transition between this utterance and the previous one.
Status Optional
Datatype teidata.enumerated
Legal values are: **smooth** this utterance begins without unusual pause or rapidity.[Default]
latching this utterance begins with a markedly shorter pause than normal.
overlap this utterance begins before the previous one has finished.
pause this utterance begins after a noticeable pause.

character data

Note Prose and a mixture of speech elements

Although individual transcriptions may consistently use <u> elements for turns or other units, and although in most cases a <u> will be delimited by pause or change of speaker, <u> is not required to represent a turn or any communicative event, nor to be bounded by pauses or change of speaker. At a minimum, a <u> is some phonetic production by a given speaker.

Example

```
<u  who="#spkr1">if did you set</u>
<u  trans="latching"  who="#spkr2">well Joe and I set it between us</u>
<list  type="speakers">
  <item  xml:id="spkr1"/>
  <item  xml:id="spkr2"/>
</list>
```

`@reason` indicates why the material is hard to transcribe.

Status Optional

Datatype 1–∞ occurrences of teidata.enumerated separated by whitespace

Suggested values include: **illegible** (illegible)

inaudible (inaudible)

faded (faded)

background_noise (background noise)

eccentric_ductus (eccentric ductus) indicates illegibility due to an unusual, awkward, or incompetent execution of a glyph or glyphs

```
<div>
  <head>Rx</head>
  <p>500 mg <unclear  reason="illegible">placebo</unclear>
  </p>
</div>
```

Note One or more words may be used to describe the reason; usually each word will refer to a single cause.

`@agent` Where the difficulty in transcription arises from damage, categorizes the cause of the damage, if it can be identified.

Status Optional

Datatype teidata.enumerated

Sample values include: **rubbing** damage results from rubbing of the leaf edges

mildew damage results from mildew on the leaf surface

smoke damage results from smoke

character data

Note The same element is used for all cases of uncertainty in the transcription of element content, whether for written or spoken material. For other aspects of certainty, uncertainty, and reliability of tagging and transcription, see chapter *22. Certainty, Precision, and Responsibility*.

The <damage>, <gap>, <del>, <unclear> and <supplied> elements may be closely allied in use. See section *12.3.3.2. Use of the gap, del, damage, unclear, and supplied Elements in Combination* for discussion of which element is appropriate for which circumstance.

The *hand* attribute points to a definition of the hand concerned, as further discussed in section *12.3.2.1. Document Hands*.

Example

```
<u> ...and then <unclear  reason="background-noise">Nathalie</unclear> said ...
</u>
```

Content model

```
<content>
 <macroRef key="macro.paraContent"/>
</content>
```

Schema Declaration

```

transcr: am damage fw line metamark mod restore retrace secl supplied surplus zone

verse: rhyme

May contain Empty element

Example

```
<line>This is <del  change="#s2"  rend="overstrike">
    <seg  xml:id="undo-a">just some</seg>
     sample <seg  xml:id="undo-b">text</seg>,
     we need</del>
  <add  change="#s2">not</add>
a real example.</line>
<undo  target="#undo-a #undo-b"
  rend="dotted"  change="#s3"/>
```

This encoding represents the following sequence of events:

- ”This is just some sample text, we need a real example” is written
- At stage s2, ”just some sample text, we need” is deleted by overstriking, and ”not” is added
- At stage s3, parts of the deletion are cancelled by underdotting, thus reinstating the words ”just some” and ”text”.

Content model `<content> <empty/></content>`

character data

Example Here is an example of a <unit> element holding a *unitRef* attribute that points to a definition of the unit in the TEI header.

```
<measure>
  <num>3</num>
  <unit  unitRef="#ell">ells</unit>
</measure>
<!-- In the TEI Header: -->
<encodingDesc>
  <unitDecl>
    <unitDef  xml:id="ell">
      <label>ell</label>
      <placeName  ref="#iceland"/>
      <desc>A unit of measure for cloth, roughly equivalent to 18 inches, or
from an adult male's elbow to the tip of the middle finger.</desc>
    </unitDef>
  </unitDecl>
</encodingDesc>
```

Example

```
<measure>
  <num>2</num>
  <unit>kg</unit>
</measure>
```

Example

```
<measure  type="value">
  <num>3</num>
  <unit  type="time"  unit="min">minute</unit>
</measure>
```

Example

```
<measure  type="interval">
  <num  atLeast="1.2">1.2</num> to <num  atMost="5.6">5.6</num>
  <unit  type="velocity"  unit="km/h">km/h</unit>
</measure>
```

Example

```
<p>Light travels at <num  value="3E10">3×10^10</num>
  <unit  type="rate"  unit="cm/s">
```

```
      <unit type="space">cm</unit> per <unit type="time">second</unit>
    </unit>.</p>
```

Content model

```
<content>
 <macroRef key="macro.phraseSeq"/>
</content>
```

Schema Declaration

```
element unit
{
   att.global.attributes,
   att.global.analytic.attributes,
   att.global.change.attributes,
   att.global.facs.attributes,
   att.global.linking.attributes,

  * *@cert*
  * *@resp*
- – att.global.source
  * *@source*

`@method` indicates which method is used to encode the apparatus of variants.
Status Required
Datatype teidata.enumerated
Legal values are: **location-referenced** apparatus uses line numbers or other canonical reference scheme referenced in a base text.
double-end-point apparatus indicates the precise locations of the beginning and ending of each lemma relative to a base text.
parallel-segmentation alternate readings of a passage are given in parallel in the text; no notion of a base text is necessary.
Note The value 'parallel-segmentation' requires in-line encoding of the apparatus.

`@location` indicates whether the apparatus appears within the running text or external to it.
Status Required
Datatype teidata.enumerated

Schematron <sch:rule context="tei:variantEncoding"> <sch:report test="@location eq 'external' and @method eq 'parallel-segmentation'"> The @location value "external" is inconsistent with the parallel-segmentation method of apparatus markup.</sch:report> </sch:rule>

Legal values are: **internal** apparatus appears within the running text.

external apparatus appears outside the base text.

Note The value 'external' is inconsistent with the parallel-segmentation method of apparatus markup.

character data

Note A view is a particular form of stage direction.

Example

```
<view>
  <name>Max</name> joins his daughter
at the window. <hi>Rain</hi> sprays his
face--
</view>
<view>
  <camera>Max's POV</camera> He sees occasional
windows open, and just across from his apartment
house, a <hi>man</hi> opens the front door of
a brownstone--
</view>
```

Example

```
<div  type="shot">
  <view>BBC World symbol</view>
  <sp>
    <speaker>Voice Over</speaker>
```

```
      <p>Monty Python's Flying Circus tonight comes to you live
          from the Grillomat Snack Bar, Paignton.</p>
    </sp>
  </div>
  <div  type="shot">
    <view>Interior of a nasty snack bar. Customers around, preferably
       real people. Linkman sitting at one of the plastic tables.</view>
    <sp>
      <speaker>Linkman</speaker>
      <p>Hello to you live from the Grillomat Snack Bar.
      </p>
    </sp>
  </div>

   att.global.responsibility.attributes,
   att.global.source.attributes,
   attribute name { text },
   model.featureVal?
}
```

<vMerge> (merged collection of values) represents a feature value which is the result of merging together the feature values contained by its children, using the organization specified by the *org* attribute. [*19.8.3. Collection of Values*]

Module iso-fs — Feature Structures

Attributes

- att.global
  - *@xml:id*
  - *@n*
  - *@xml:lang*
  - *@xml:base*
  - *@xml:space*
  - att.global.analytic
    - *@ana*
  - att.global.change
    - *@change*
  - att.global.facs
    - *@facs*
  - att.global.linking
    - *@corresp*
    - *@synch*

* *@prev*
* *@exclude*
* *@select*

– att.global.rendition
* *@rend*
* *@style*
* *@rendition*

– att.global.responsibility
* *@cert*
* *@resp*

– att.global.source
* *@source*

`@org` indicates the organization of the resulting merged values as set, bag or list.

Status Optional

Datatype teidata.enumerated

Legal values are: **set** indicates that the resulting values are organized as a set.

bag indicates that the resulting values are organized as a bag (multiset).

list indicates that the resulting values are organized as a list.

Member of model.featureVal.complex

Contained by

iso-fs: f fvLib if vAlt vDefault vLabel vMerge vNot vRange

May contain

iso-fs: binary default fs numeric string symbol vAlt vColl vLabel vMerge vNot

Example

```
<vMerge org="list">
  <vColl org="set">
    <symbol value="masculine"/>
    <symbol value="neuter"/>
    <symbol value="feminine"/>
  </vColl>
  <symbol value="indeterminate"/>
</vMerge>
```

This example returns a list, concatenating the indeterminate value with the set of values masculine, neuter and feminine.

Content model

```
<content>
 <classRef key="model.featureVal"
  minOccurs="1" maxOccurs="unbounded"/>
</content>
```

Schema Declaration

```
element vMerge
{
```

```
   att.global.attributes,
   att.global.analytic.attributes,

  - att.global.source
    - *@source*

`@absolute` supplies an absolute value for the time.

Status Optional

Datatype teidata.temporal.w3c

Note This attribute should always be specified on a <when> element which serves as the target for the *origin* attribute of a <timeline>.

`@unit` specifies the unit of time in which the *interval* value is expressed, if this is not inherited from the parent <timeline>.

Status Optional

Datatype teidata.enumerated

Suggested values include: **d** (days)

h (hours)

min (minutes)

s (seconds)

ms (milliseconds)

`@interval` specifies a time interval either as a number or as one of the keywords defined by the datatype `teidata.interval`.

Status Optional

Datatype teidata.interval

`@since` identifies the reference point for determining the time of the current <when> element, which is obtained by adding the interval to the time of the reference point.

Status Optional

Datatype teidata.pointer

Note This attribute should point to another <when> element in the same <timeline>. If no value is supplied, and the *absolute* attribute is also unspecified, then the reference point is understood to be the origin of the enclosing <timeline> tag.

Contained by: timeline

May contain Empty element

Note On this element, the global *xml:id* attribute must be supplied to specify an identifier for this point in time. The value used may be chosen freely provided that it is unique within the document and is a syntactically valid name. There is no requirement for values containing numbers to be in sequence.

Example

```
<when xml:id="TW3" interval="20" since="#w2"/>
```

Content model `<content> <empty/></content>`

Schema Declaration

```
element when
{
   att.global.attributes,
   att.global.analytic.attributes,
   att.global.change.attributes,
   att.global.facs.attributes,
   att.global.linking.attributes,
   att.global.rendition.attributes,
   att.global.responsibility.attributes,
   att.global.source.attributes,
   attribute absolute { text }?,
   attribute unit { "d" | "h" | "min" | "s" | "ms" }?,
   attribute interval { text }?,
   attribute since { text }?,
   empty
}
```

<width> (width) contains a measurement of an object along the axis parallel to its bottom, e.g. perpendicular to the spine of a book or codex. [*11.3.4. Dimensions*]

character data

Note The <witDetail> element was formerly permitted anywhere that <note> could appear, but since it should only be used in association with <lem> and <rdg>, it is recommended that it be placed immediately following the reading that it modifies, in the same <app>. A <witDetail> without a *target* attribute should be assumed to refer to the closest preceding <lem> or <rdg>.

Example

```
<app type="substantive">
  <lem xml:id="W026x" wit="#El #HG">Experience</lem>
  <rdg wit="#Ha4">Experiens</rdg>
  <witDetail target="#W026x" resp="#PR"
    wit="#El" type="presentation">Ornamental capital.</witDetail>
</app>
```

Content model

```
<content>

character data

Note The content of the <witness> element may give bibliographic information about the witness or witness group, or it may be empty.

Example

```
<listWit>
  <witness  xml:id="EL">Ellesmere, Huntingdon Library 26.C.9</witness>
  <witness  xml:id="HG">Hengwrt, National Library of Wales,
     Aberystwyth, Peniarth 392D</witness>
  <witness  xml:id="RA2">Bodleian Library Rawlinson Poetic 149
     (see further
<ptr  target="http://www.examples.com/MSdescs#MSRP149"/>)</witness>
</listWit>
```

Content model

```
<content>
 <alternate minOccurs="0"
  maxOccurs="unbounded">
  <textNode/>
  <classRef key="model.limitedPhrase"/>
  <classRef key="model.inter"/>
  <elementRef key="note"/>
  <elementRef key="object"/>
 </alternate>
</content>
```

Schema Declaration

```
element witness
{
   att.global.attributes,
   att.global.analytic.attributes,
   att.global.change.attributes,
   att.global.facs.attributes,
   att.global.linking.attributes,
   att.global.rendition.attributes,
   att.global.responsibility.attributes,
   att.global.source.attributes,
   att.sortable.attributes,
   ( text | model.limitedPhrase | model.inter | note | object )*
}
```

<witStart> (fragmented witness start) indicates the beginning, or resumption, of the text of a fragmentary witness. [*13.1.5. Fragmentary Witnesses*]

`@gradual` indicates whether the writing is revealed all at once or gradually.

Status Optional

Datatype teidata.xTruthValue

Note The value true indicates the writing is revealed gradually; the value false that the writing is revealed all at once.

character data

Note The <writing> element will usually be short and most simply transcribed as a character string; the content model also allows a sequence of paragraphs and paragraph-level elements, in case the writing has enough internal structure to warrant such markup. In either case the usual phrase-level tags for written text are available.

Example

```
<!-- ... --><l>man in a coonskin cap</l>
<writing>coonskin</writing>
<l>in a pig pen</l>
<writing>pig pen</writing>
<l>wants eleven dollar bills</l>
<writing>20 dollar bills</writing>
<l>you only got ten</l>
<writing>10</writing>
<!-- ... -->
```

Content model

```
<content>
 <macroRef key="macro.paraContent"/>
</content>
```

May contain ANY

Example This example presumes that the prefix `dc` has been bound to the namespace `http://purl.org/dc/elements/1.1/` and the prefix `rdf` is bound to the namespace `http://www.w3.org/1999/02/22-rdf-syntax-ns#`. Note: The *about* attribute on the `<rdf:Description>` in this example gives a URI indicating the resource to which the metadata contained therein refer. The `<rdf:Description>` in the second <xenoData> block has a blank *about*, meaning it is pointing at the *current* document, so the RDF is about the document within which it is contained, i.e. the TEI document containing the <xenoData> block. Similarly, any kind of relative URI

may be used, including fragment identifiers (see *v.6.2 Identifiers and Indicators*). Do note, however, that if the contents of the <xenoData> block are to be extracted and used elsewhere, any relative URIs will have to be resolved accordingly.

```
<xenoData
   xmlns:dc="http://purl.org/dc/elements/1.1/"
   xmlns:rdf="http://www.w3.org/1999/02/22-rdf-syntax-ns#">
  <rdf:RDF>
    <rdf:Description  rdf:about="http://www.worldcat.org/oclc/606621663">
      <dc:title>The description of a new world, called the
blazing-world</dc:title>
      <dc:creator>The Duchess of Newcastle</dc:creator>
      <dc:date>1667</dc:date>
      <dc:identifier>British Library, 8407.h.10</dc:identifier>
      <dc:subject>utopian fiction</dc:subject>
    </rdf:Description>
  </rdf:RDF>
</xenoData>
<xenoData>
  <rdf:RDF>
    <rdf:Description  rdf:about="">
      <dc:title>The Description of a New World, Called the Blazing-World,
1668</dc:title>
      <dc:creator>Cavendish, Margaret (Lucas), Duchess of Newcastle</dc:creator>
      <dc:publisher>Women Writers Project</dc:publisher>
      <dc:date>2002-02-12</dc:date>
      <dc:subject>utopian fiction</dc:subject>
    </rdf:Description>
  </rdf:RDF>
</xenoData>
```

Example In this example, the prefix `rdf` is bound to the namespace `http://www.w3.org/1999/02/22-rdf-syntax-ns#`, the prefix `dc` is bound to the namespace `http://purl.org/dc/elements/1.1/`, and the prefix `cc` is bound to the namespace `http://web.resource.org/cc/`.

```
<xenoData
   xmlns:cc="http://web.resource.org/cc/"
   xmlns:dc="http://purl.org/dc/elements/1.1/"
   xmlns:rdf="http://www.w3.org/1999/02/22-rdf-syntax-ns#">
  <rdf:RDF>
    <cc:Work  rdf:about="">
      <dc:title>Applied Software Project Management - review</dc:title>
      <dc:type  rdf:resource="http://purl.org/dc/dcmitype/Text"/>
      <dc:license  rdf:resource="http://creativecommons.org/licenses/by-sa/2.0/uk/"/>
    </cc:Work>
    <cc:License  rdf:about="http://creativecommons.org/licenses/by-sa/2.0/uk/">
      <cc:permits  rdf:resource="http://web.resource.org/cc/Reproduction"/>
      <cc:permits  rdf:resource="http://web.resource.org/cc/Distribution"/>
      <cc:requires  rdf:resource="http://web.resource.org/cc/Notice"/>
      <cc:requires  rdf:resource="http://web.resource.org/cc/Attribution"/>
      <cc:permits  rdf:resource="http://web.resource.org/cc/DerivativeWorks"/>
      <cc:requires  rdf:resource="http://web.resource.org/cc/ShareAlike"/>
    </cc:License>
  </rdf:RDF>
</xenoData>
```

Example In this example, the prefix `dc` is again bound to the namespace

http://www.openarchives.org/OAI/2.0/oai_dc/, and the prefix oai_dc is bound to the namespace http://www.openarchives.org/OAI/2.0/oai_dc/.

```
<xenoData
   xmlns:dc="http://purl.org/dc/elements/1.1/"
   xmlns:oai_dc="http://www.openarchives.org/OAI/2.0/oai_dc/">
  <oai_dc:dc>
    <dc:title>The colonial despatches of Vancouver Island and British
        Columbia 1846-1871: 11566, CO 60/2, p. 291; received 13 November.
        Trevelyan to Merivale (Permanent Under-Secretary)</dc:title>
    <dc:date>1858-11-12</dc:date>
    <dc:creator>Trevelyan</dc:creator>

Example This example shows GeoJSON embedded in <xenoData>. Note that JSON does not permit newlines inside string values. These must be escaped as `\n`. To avoid the accidental insertion of newlines by software, the use of *xml:space* is recommended. Blocks of JSON should be wrapped in CDATA sections, as they may contain characters illegal in XML.

```
<xenoData xml:space="preserve">

character data
Note May contain character data and phrase-level elements; usually contains a <ref> or a <ptr> element.
This element encloses both the actual indication of the location referred to, which may be tagged using the <ref> or <ptr> elements, and any accompanying material which gives more information about why the reader is being referred there.
Example

```
<entry>
  <form>
    <orth>lavage</orth>
  </form>
  <etym>[Fr. < <mentioned>laver</mentioned>; L. <mentioned>lavare</mentioned>,
to wash;
  <xr>see <ref>lather</ref>
    </xr>]. </etym>
</entry>
```

Example

```
<entry>
  <form>
    <orth>lawful</orth>
  </form>
  <xr  type="syn">SYN. see <ref>legal</ref>
  </xr>
</entry>
```

`@rotate` indicates the amount by which this zone has been rotated clockwise, with respect to the normal orientation of the parent <surface> element as implied by the dimensions given in the <msDesc> element or by the coordinates of the <surface> itself. The orientation is expressed in arc degrees.
Status Optional
Datatype teidata.numeric

textcrit: app witDetail
transcr: addSpan damage damageSpan delSpan fw handShift line listTranspose metamark mod path redo restore retrace space substJoin surface undo zone
character data
Note The position of every zone for a given surface is always defined by reference to the coordinate system defined for that surface.

A graphic element contained by a zone represents the whole of the zone.

A zone may be of any shape. The attribute *points* may be used to define a polygonal zone, using the coordinate system defined by its parent surface.

A zone is always a closed polygon. Repeating the initial coordinate at the end of the sequence is optional. To encode an unclosed path, use the <path> element.
Example

```
<surface ulx="14.54" uly="16.14" lrx="0"
  lry="0">
  <graphic url="stone.jpg"/>
  <zone points="4.6,6.3 5.25,5.85 6.2,6.6 8.19222,7.4125 9.89222,6.5875
10.9422,6.1375 11.4422,6.7125 8.21722,8.3125 6.2,7.65"/>
</surface>
```

This example defines a non-rectangular zone: see the illustration in section *12.2.2.1. Advanced Uses of surface and zone.*
Example

```
<facsimile>
  <surface ulx="50" uly="20" lrx="400"
    lry="280">
    <zone ulx="0" uly="0" lrx="500" lry="321">
      <graphic url="graphic.png"/>
    </zone>
  </surface>
</facsimile>
```

This example defines a zone which has been defined as larger than its parent surface in order to match the dimensions of the graphic it contains.

Content model

```
<content>
 <alternate minOccurs="0"
  maxOccurs="unbounded">
  <textNode/>
  <classRef key="model.gLike"/>
  <classRef key="model.graphicLike"/>
  <classRef key="model.global"/>
  <elementRef key="surface"/>
  <classRef key="model.linePart"/>
 </alternate>
</content>
```

E Datatypes and Other Macros

E.1 About the Datatypes and Macros Appendix

This appendix gives you a list of datypes and links to the reference pages for them. There are 35 distinctly-named data specifications in revision 113e933e2 of TEI P5 Version 4.12.0 of the TEI Guidelines.

---

macro.abContent (anonymous block content) defines the content of anonymous block elements. [*1.3. The TEI Class System*]

Module tei — The TEI Infrastructure

Used by ab

Content model

```
<content>
 <alternate minOccurs="0"
  maxOccurs="unbounded">
  <textNode/>
  <classRef key="model.paraPart"/>
  <elementRef key="ab"/>
 </alternate>
</content>
```

Declaration

```
macro.abContent = ( text | model.paraPart | ab )*
```

---

macro.limitedContent (paragraph content) defines the content of prose elements that are not used for transcription of extant materials. [*1.3. The TEI Class System*]

Module tei — The TEI Infrastructure

Used by desc fDescr figDesc fsDescr meeting rendition tagUsage

Content model

```
<content>
 <alternate minOccurs="0"
  maxOccurs="unbounded">
  <textNode/>
  <classRef key="model.limitedPhrase"/>
  <classRef key="model.inter"/>
 </alternate>
</content>
```

Declaration

```
macro.limitedContent = ( text | model.limitedPhrase | model.inter )*
```

---

macro.paraContent (paragraph content) defines the content of paragraphs and similar elements. [*1.3. The TEI Class System*]

Module tei — The TEI Infrastructure

Used by add camera caption case colloc corr damage def del docEdition emph gen gram hi hyph iType imprimatur lang lbl mod mood number orig orth p per pos pron ref reg restore retrace rhyme salute secl seg sic signed sound stress subc supplied surplus syll tech title titlePart tns u unclear usg writing

Content model

```
<content>
 <alternate minOccurs="0"
  maxOccurs="unbounded">
  <textNode/>
  <classRef key="model.paraPart"/>
 </alternate>
</content>
```

Declaration `macro.paraContent = ( text | model.paraPart )*`

---

macro.phraseSeq (phrase sequence) defines a sequence of character data and phrase-level elements. [*1.4.1. Standard Content Models*]

Module tei — The TEI Infrastructure

Used by abbr actor addName addrLine affiliation author biblScope birth bloc catchwords citedRange cl colophon country death distinct distributor district docAuthor docDate edition editor education eg email eventName expan explicit extent faith finalRubric floruit foreign forename fw genName gender geoDecl geogFeat geogName gloss headItem headLabel heraldry incipit label material measure mentioned name nameLink nationality num objectName objectType offset orgName origPlace persName persPronouns phr placeName pubPlace publisher rb region residence role roleDesc roleName rs rt rubric s secFol settlement sex soCalled socecStatus speaker stamp street surname term unit watermark wit

Content model

```

  <classRef key="model.attributable"/>
  <classRef key="model.phrase"/>
  <classRef key="model.global"/>
 </alternate>
</content>
```

Declaration

```
macro.phraseSeq =
   ( text | model.gLike | model.attributable | model.phrase | model.global )*
```

---

macro.phraseSeq.limited (limited phrase sequence) defines a sequence of character data and those phrase-level elements that are not typically used for transcribing extant documents. [*1.4.1. Standard Content Models*]

Module tei — The TEI Infrastructure

Used by activity age authority channel classCode collection constitution derivation domain factuality funder institution interaction langKnown language locale metSym preparedness principal purpose repository resp span sponsor valDesc

Content model

```
<content>
 <alternate minOccurs="0"
  maxOccurs="unbounded">
  <textNode/>
  <classRef key="model.limitedPhrase"/>
  <classRef key="model.global"/>
 </alternate>
</content>
```

Declaration

```
macro.phraseSeq.limited = ( text | model.limitedPhrase | model.global )*
```

---

macro.specialPara ('special' paragraph content) defines the content model of elements such as notes or list items, which either contain a series of component-level elements or else have the same structure as a paragraph, containing a series of phrase-level and inter-level elements. [*1.3. The TEI Class System*]

Module tei — The TEI Infrastructure

Used by accMat acquisition additions cell change collation condition custEvent decoNote filiation foliation handNote item layout licence metamark musicNotation note occupation origin provenance q quote said scriptNote signatures source stage summary support surrogates textLang typeNote view

Content model

```
<content>
 <alternate minOccurs="0"
  maxOccurs="unbounded">
  <textNode/>
  <classRef key="model.gLike"/>
  <classRef key="model.phrase"/>
  <classRef key="model.inter"/>
  <classRef key="model.divPart"/>
  <classRef key="model.global"/>
 </alternate>
</content>
```

Declaration

```
macro.specialPara =
   (
      text
    | model.gLike    | model.phrase    | model.inter    | model.divPart    | model.global
```

---

macro.specialPara.cmc ('special' paragraph content with added CMC element(s)) defines the content model of the <quote> element, whose content is just like others (such as notes or list items) which either contain a series of component-level elements or else have the same structure as a paragraph, containing a series of phrase-level and inter-level elements, but also contains element(s) for transcription of CMC.

Module cmc — Computer-mediated Communication

Used by

Content model

```
<content>
 <alternate minOccurs="0"
  maxOccurs="unbounded">
  <textNode/>
  <classRef key="model.gLike"/>
  <classRef key="model.phrase"/>
  <classRef key="model.inter"/>
  <classRef key="model.divPart"/>
  <classRef key="model.global"/>
  <classRef key="model.cmc"/>
 </alternate>
</content>
```

Declaration

```
macro.specialPara.cmc =
   (
      text
    | model.gLike    | model.phrase    | model.inter    | model.divPart    | model.global
```

---

macro.xtext (extended text) defines a sequence of character data and gaiji elements.

Module tei — The TEI Infrastructure

Used by c depth dim ex height mapping memberOf string width

Content model

```
<content>
 <alternate minOccurs="0"
  maxOccurs="unbounded">
  <textNode/>
  <classRef key="model.gLike"/>
 </alternate>
</content>
```

Declaration

```
macro.xtext = ( text | model.gLike )*
```

---

teidata.authority defines attribute values which derive from an authority list, which may be an enumerated list defined in the document's schema, a list or taxonomy elsewhere in the document, or an online taxonomy, gazetteer, or other authority.

Module tei — The TEI Infrastructure

Used by Element:

- move/@where

Content model

```
<content>
 <alternate>
```

```
  <dataRef key="teidata.enumerated"/>
  <dataRef key="teidata.pointer"/>
 </alternate>
</content>
```

Declaration

```
teidata.authority = teidata.enumerated | teidata.pointer
```

Note Attribute values with this datatype should either come from a value list in the attribute specification (`teidata.enumerated`) or be a valid URI (`teidata.pointer`).

---

teidata.certainty defines the range of attribute values expressing a degree of certainty.

Module tei — The TEI Infrastructure

Used by teidata.probCertElement:

- certainty/@cert
- precision/@precision
- purpose/@degree

Content model

```
<content>
 <valList type="closed">
  <valItem ident="high"/>
  <valItem ident="medium"/>
  <valItem ident="low"/>
  <valItem ident="unknown"/>
 </valList>
</content>
```

Declaration `teidata.certainty = "high" | "medium" | "low" | "unknown"`

Note Certainty may be expressed by one of the predefined symbolic values high, medium, or low. The value unknown should be used in cases where the encoder does not wish to assert an opinion about the matter.

---

teidata.count defines the range of attribute values used for a non-negative integer value used as a count.

Module tei — The TEI Infrastructure

Used by Element:

- age/@value
- datatype/@minOccurs
- graph/@order
- graph/@size
- handDesc/@hands
- iNode/@outDegree
- layout/@columns
- layout/@streams

- layout/@ruledLines
- layout/@writtenLines
- node/@inDegree
- node/@outDegree
- node/@degree
- refState/@length
- root/@outDegree
- sense/@level
- table/@rows
- table/@cols
- tagUsage/@occurs
- tagUsage/@withId
- tree/@arity
- tree/@order

Content model

```
<content>
 <dataRef name="nonNegativeInteger"/>
</content>
```

Declaration `teidata.count = xsd:nonNegativeInteger`

Note Any positive integer value or zero is permitted

---

teidata.duration.iso defines the range of attribute values available for representation of a duration in time using ISO 8601 standard formats.

Module tei — The TEI Infrastructure

Used by

Content model

```
<content>
 <dataRef name="token"
  restriction="[0-9.,DHMPRSTWYZ/:+\-]+"/>
</content>
```

Declaration

```
teidata.duration.iso = token { pattern = "[0-9.,DHMPRSTWYZ/:+\-]+" }
```

Example

```
<time dur-iso="PT0,75H">three-quarters of an hour</time>
```

Example

```
<date dur-iso="P1,5D">a day and a half</date>
```

Example

```
<date dur-iso="P14D">a fortnight</date>
```

Example

```
<time dur-iso="PT0.02S">20 ms</time>
```

Note A duration is expressed as a sequence of number-letter pairs, preceded by the letter P; the letter gives the unit and may be Y (year), M (month), D (day), H (hour), M (minute), or S (second), in that order. The numbers are all unsigned integers, except for the last, which may have a decimal component (using either `.` or `,` as the decimal point; the latter is preferred). If any number is *0*, then that number-letter pair may be omitted. If any of the H (hour), M (minute), or S (second) number-letter pairs are present, then the separator `T` must precede the first 'time' number-letter pair.

For complete details, see ISO 8601 *Data elements and interchange formats — Information interchange — Representation of dates and times*.

---

teidata.duration.w3c defines the range of attribute values available for representation of a duration in time using W3C datatypes.

Module tei — The TEI Infrastructure

Used by

Content model `<content> <dataRef name="duration"/></content>`

Declaration `teidata.duration.w3c = xsd:duration`

Example

```
<time dur="PT45M">forty-five minutes</time>
```

Example

```
<date dur="P1DT12H">a day and a half</date>
```

Example

```
<date dur="P7D">a week</date>
```

Example

```
<time dur="PT0.02S">20 ms</time>
```

Note A duration is expressed as a sequence of number-letter pairs, preceded by the letter P; the letter gives the unit and may be Y (year), M (month), D (day), H (hour), M (minute), or S (second), in that order. The numbers are all unsigned integers, except for the `S` number, which may have a decimal component (using `.` as the decimal point). If any number is *0*, then that number-letter pair may be omitted. If any of the H (hour), M (minute), or S (second) number-letter pairs are present, then the separator `T` must precede the first 'time' number-letter pair.

For complete details, see the W3C specification.

---

teidata.enumerated defines the range of attribute values expressed as a single XML name taken from a list of documented possibilities.

Module tei — The TEI Infrastructure

Used by teidata.authority teidata.gender teidata.sexElement:

- abbr/@type
- address/@type
- address/@role

Content model `<content> <dataRef key="teidata.word"/></content>`

Declaration `teidata.enumerated = teidata.word`

Note Attributes using this datatype must contain a single 'word' which contains only letters, digits, punctuation characters, or symbols: thus it cannot include whitespace.

Typically, the list of documented possibilities will be provided (or exemplified) by a value list in the associated attribute specification, expressed with a <valList> element.

---

teidata.gender defines the range of attribute values used to represent the gender of a person, persona, or character.

Module tei — The TEI Infrastructure

Used by Element:

- actor/@gender
- gender/@value
- person/@gender
- personGrp/@gender
- persona/@gender
- role/@gender

Content model

```
<content>
 <dataRef key="teidata.enumerated"/>
</content>
```

Declaration `teidata.gender = teidata.enumerated`

Note Values for attributes using this datatype may be defined locally by a project, or they may refer to an external standard.

Values for this datatype should not be used to encode morphological gender (cf. <gen>, *msd* as defined in `att.linguistic`, and *10.3.1. Information on Written and Spoken Forms*).

---

teidata.interval defines attribute values used to express an interval value.

Module tei — The TEI Infrastructure

Used by Element:

- timeline/@interval
- when/@interval

Content model

```
<content>
 <alternate>
  <dataRef name="float"/>
  <valList>
   <valItem ident="regular"/>
   <valItem ident="irregular"/>
   <valItem ident="unknown"/>
  </valList>
 </alternate>
</content>
```

Declaration

```
teidata.interval = xsd:float | ( "regular" | "irregular" | "unknown" )
```

Note Any value greater than zero or any one of the values regular, irregular, unknown.

---

teidata.language defines the range of attribute values used to identify a particular combination of human language and writing system. [*vi.1 Language Identification*]

Module tei — The TEI Infrastructure

Used by Element:

- langKnowledge/@tags
- langKnown/@tag
- language/@ident
- schemaSpec/@targetLang
- schemaSpec/@docLang
- textLang/@mainLang
- textLang/@otherLangs

Content model

```
<content>
 <alternate>
  <dataRef name="language"/>
  <valList>
   <valItem ident=""/>
  </valList>
 </alternate>
```

```
</content>
```

Declaration `teidata.language = xsd:language | ( "" )`

Note The values for this attribute are language 'tags' as defined in BCP 47. Currently BCP 47 comprises RFC 5646 and RFC 4647; over time, other IETF documents may succeed these as the best current practice.

A 'language tag', per BCP 47, is assembled from a sequence of components or *subtags* separated by the hyphen character (-, U+002D). The tag is made of the following subtags, in the following order. Every subtag except the first is optional. If present, each occurs only once, except the fourth and fifth components (variant and extension), which are repeatable.

language The IANA-registered code for the language. This is almost always the same as the ISO 639 2-letter language code if there is one. The list of available registered language subtags can be found at `https://www.iana.org/assignments/language-subtag-registry`. It is recommended that this code be written in lower case.

script The ISO 15924 code for the script. These codes consist of 4 letters, and it is recommended they be written with an initial capital, the other three letters in lower case. The canonical list of codes is maintained by the Unicode Consortium, and is available at `https://unicode.org/iso15924/iso15924-codes.html`. The IETF recommends this code be omitted unless it is necessary to make a distinction you need.

region Either an ISO 3166 country code or a UN M.49 region code that is registered with IANA (not all such codes are registered, e.g. UN codes for economic groupings or codes for countries for which there is already an ISO 3166 2-letter code are not registered). The former consist of 2 letters, and it is recommended they be written in upper case; the list of codes can be searched or browsed at `https://www.iso.org/obp/ui/#search/code/`. The latter consist of 3 digits; the list of codes can be found at `http://unstats.un.org/unsd/methods/m49/m49.htm`.

variant An IANA-registered variation. These codes 'are used to indicate additional, well-recognized variations that define a language or its dialects that are not covered by other available subtags'.

extension An extension has the format of a single letter followed by a hyphen followed by additional subtags. There are currently only two extensions in use. Extension `T` indicates that the content was transformed. For example en-t-it could be used for content in English that was translated from Italian. Extension T is described in the informational RFC 6497. Extension `U` can be used to embed a variety of locale attributes. It is described in the informational RFC 6067.

private use An extension that uses the initial subtag of the single letter *x* (i.e., starts with `x-`) has no meaning except as negotiated among the parties involved. These should be used with great care, since they interfere with the interoperability that use of RFC 4646 is intended to promote. In order for a document that makes use of these subtags to be TEI-conformant, a corresponding <language> element must be present in the TEI header.

There are two exceptions to the above format. First, there are language tags in the IANA registry that do not match the above syntax, but are present because they have been 'grandfathered' from previous specifications.

Second, an entire language tag can consist of only a private use subtag. These tags start with `x-`, and do not need to follow any further rules established by the IETF and endorsed by these Guidelines. Like all language tags that make use of private use subtags, the language in question must be documented in a corresponding <language> element in the TEI header.

Examples include

sn Shona

zh-TW Taiwanese

zh-Hant-HK Chinese written in traditional script as used in Hong Kong

en-SL English as spoken in Sierra Leone

pl Polish

es-MX Spanish as spoken in Mexico

es-419 Spanish as spoken in Latin America

The W3C Internationalization Activity has published a useful introduction to BCP 47, Language tags in HTML and XML.

---

teidata.name defines the range of attribute values expressed as an XML Name.

Module tei — The TEI Infrastructure

Used by att giElement:

- application/@ident
- attRef/@class
- attRef/@name
- attRef/@key
- equiv/@name
- f/@name
- fDecl/@name
- fsDecl/@baseTypes
- index/@indexName
- join/@result
- joinGrp/@result
- memberOf/@key
- model/@cssClass
- remarks/@ident
- schemaSpec/@start
- specDesc/@key
- specDesc/@atts
- tagUsage/@gi
- transcriptionDesc/@ident

Content model `<content> <dataRef name="Name"/></content>`

Declaration `teidata.name = xsd:Name`

Note Attributes using this datatype must contain a single word which follows the rules defining a legal XML name (see `https://www.w3.org/TR/REC-xml/#dt-name`): for example they cannot include whitespace or begin with digits.

---

teidata.namespace defines the range of attribute values used to indicate XML namespaces as defined by the W3C Namespaces in XML Technical Recommendation.

Module tei — The TEI Infrastructure

Used by Element:

- anyElement/@require
- namespace/@name

Content model

```
<content>
 <dataRef restriction="\S+" name="anyURI"/>
</content>
```

Declaration `teidata.namespace = xsd:anyURI { pattern = "\S+" }`

Note The range of syntactically valid values is defined by RFC 3986 *Uniform Resource Identifier (URI): Generic Syntax*

---

teidata.namespaceOrName defines attribute values which contain either an absolute namespace URI or a qualified XML name.

Module tei — The TEI Infrastructure

Used by Element:

- anyElement/@except
- schemaSpec/@defaultExceptions

Content model

```
<content>
 <alternate>
  <dataRef name="anyURI">
   <dataFacet name="pattern"
    value="[^/\s]+:\S*"/>
  </dataRef>
  <dataRef name="Name">
   <dataFacet name="pattern" value=".+:.+"/>
  </dataRef>
 </alternate>
</content>
```

Declaration `teidata.namespaceOrName = xsd:anyURI | xsd:Name`

---

teidata.nullOrName defines attribute values which contain either the null string or an XML name.

Module tei — The TEI Infrastructure

Used by

Content model

```
<content>
 <alternate>
  <valList>
   <valItem ident=""/>
  </valList>
  <dataRef name="NCName"/>
 </alternate>
</content>
```

Declaration `teidata.nullOrName = ( "" ) | xsd:NCName`

Note The rules defining an XML name form a part of the XML Specification.

teidata.numeric defines the range of attribute values used for numeric values.

Module tei — The TEI Infrastructure

Used by Element:

- memberOf/@max
- memberOf/@min
- num/@value
- numeric/@value
- numeric/@max
- precision/@stdDeviation
- zone/@rotate

Content model

```
<content>
 <alternate>
  <dataRef name="double"/>
  <dataRef name="token"
   restriction="(\-?[\d]+/\-?[\d]+)"/>
  <dataRef name="decimal"/>
 </alternate>
</content>
```

Declaration

```
teidata.numeric =
   xsd:double | token { pattern = "(\-?[\d]+/\-?[\d]+)" } | xsd:decimal
```

Note Any numeric value, represented as a decimal number, in floating point format, or as a ratio.

To represent a floating point number, expressed in scientific notation, 'E notation', a variant of 'exponential notation', may be used. In this format, the value is expressed as two numbers separated by the letter E. The first number, the significand (sometimes called the mantissa) is given in decimal format, while the second is an integer. The value is obtained by multiplying the mantissa by 10 the number of times indicated by the integer. Thus the value represented in decimal notation as 1000.0 might be represented in scientific notation as 10E3.

A value expressed as a ratio is represented by two integer values separated by a solidus (/) character. Thus, the value represented in decimal notation as 0.5 might be represented as a ratio by the string 1/2.

teidata.outputMeasurement defines a range of values for use in specifying the size of an object that is intended for display.

Module tei — The TEI Infrastructure

Used by

Content model

```
<content>
 <dataRef name="token"
  restriction="[\-+]?\d+(\.\d+)?(%|cm|mm|in|pt|pc|px|em|ex|ch|rem|vw|vh|vmin|vmax)"/>
</content>
```

Declaration

```
teidata.outputMeasurement =
   token
   {
      pattern = "[\-+]?\d+(\.\d+)?(%|cm|mm|in|pt|pc|px|em|ex|ch|rem|vw|vh|vmin|vmax)"
   }
```

Example

```
<figure>
  <head>The TEI Logo</head>
  <figDesc>Stylized yellow angle brackets with the letters
<mentioned>TEI</mentioned> in
     between and <mentioned>text encoding initiative</mentioned> underneath,
all on a white
     background.</figDesc>
  <graphic  height="600px"  width="600px"
    url="http://www.tei-c.org/logos/TEI-600.jpg"/>
</figure>
```

Note These values map directly onto the values used by XSL-FO and CSS. For definitions of the units see those specifications; at the time of this writing the most complete list is in the CSS3 working draft.

---

teidata.pattern defines attribute values which are expressed as a regular expression.

Module tei — The TEI Infrastructure

Used by Element:

- dataRef/@restriction
- metDecl/@pattern

Content model `<content> <dataRef name="token"/></content>`

Declaration `teidata.pattern = token`

Note A regular expression, often called a *pattern*, is an expression that describes a set of strings. They are usually used to give a concise description of a set, without having to list all elements. For example, the set containing the three strings *Handel*, *Händel*, and *Haendel* can be described by the pattern `H(ä|ae?)ndel` (or alternatively, it is said that the pattern `H(ä|ae?)ndel` *matches* each of the three strings)Wikipedia

This TEI datatype is mapped to the XSD token datatype, and may therefore contain any string of characters. However, it is recommended that the value used conform to the particular flavour of regular expression syntax supported by XSD Schema.

---

teidata.point defines the data type used to express a point in cartesian space.

Module tei — The TEI Infrastructure

Used by Element:

- path/@points

Content model

```
<content>
 <dataRef name="token"
  restriction="(-?[0-9]+(\.[0-9]+)?,-?[0-9]+(\.[0-9]+)?(,-?[0-9]+(\.[0-9]+)?)?)"/>
```

```
</content>
```

Declaration

```
teidata.point =
   token
   {
      pattern = "(-?[0-9]+(\.[0-9]+)?,-?[0-9]+(\.[0-9]+)?(,-?[0-9]+(\.[0-9]+)?)?)"
   }
```

Example

```
<facsimile>
  <surface ulx="0" uly="0" lrx="400" lry="280">
    <zone points="220,100 300,210 170,250 123,234">
      <graphic url="handwriting.png"/>
    </zone>
  </surface>
</facsimile>
```

Note A point is defined by two or three numeric values separated by commas. The numeric values should be expressed as decimal numbers which do not end in a decimal point. E.g., both 0.0,84.2 and 0,84 are allowed, but 0.,84. is not.

---

teidata.pointer defines the range of attribute values used to provide a single URI, absolute or relative, pointing to some other resource, either within the current document or elsewhere.

Module tei — The TEI Infrastructure

Used by teidata.authorityElement:

- alt/@target
- annotation/@target
- app/@from
- app/@to
- arc/@from
- arc/@to
- catRef/@scheme
- certainty/@given
- change/@target
- citeData/@property
- classCode/@scheme
- conversion/@fromUnit
- conversion/@toUnit
- dataRef/@ref
- eLeaf/@value
- eTree/@value
- equiv/@uri
- equiv/@filter

- f/@fVal
- fs/@feats
- fsdLink/@target
- g/@ref
- handShift/@new
- iNode/@value
- iNode/@children
- iNode/@parent
- iNode/@follow
- keywords/@scheme
- leaf/@value
- leaf/@parent
- leaf/@follow
- locus/@scheme
- locusGrp/@scheme
- material/@target
- metamark/@target
- moduleRef/@url
- node/@value
- node/@adjTo
- node/@adjFrom
- node/@adj
- nym/@parts
- occupation/@scheme
- occupation/@code
- post/@replyTo
- redo/@target
- relatedItem/@target
- relation/@active
- relation/@mutual
- relation/@passive
- root/@value
- root/@children
- rt/@target
- rt/@from
- rt/@to
- socecStatus/@scheme
- socecStatus/@code
- space/@resp
- span/@from

- span/@to
- specGrpRef/@target
- timeline/@origin
- triangle/@value
- undo/@target
- when/@since
- witDetail/@wit

Content model

```
<content>
 <dataRef restriction="\S+" name="anyURI"/>
</content>
```

Declaration `teidata.pointer = xsd:anyURI { pattern = "\S+" }`

Note The range of syntactically valid values is defined by RFC 3986 *Uniform Resource Identifier (URI): Generic Syntax*. Note that the values themselves are encoded using RFC 3987 *Internationalized Resource Identifiers* (IRIs) mapping to URIs. For example,
`https://secure.wikimedia.org/wikipedia/en/wiki/%` is encoded as
`https://secure.wikimedia.org/wikipedia/en/wiki/%25` while
`http://مصر.موقع.وزارة-الاتصالات/` is encoded as
`http://xn--4gbrim.xn----rmckbbajlc6dj7bxne2c.xn--wgbh1c/`

---

teidata.prefix defines a range of values that may function as a URI scheme name.

Module tei — The TEI Infrastructure

Used by Element:

- prefixDef/@ident

Content model

```
<content>
 <dataRef name="token"
  restriction="[a-z][a-z0-9\+\.\-]*"/>
</content>
```

Declaration

```
teidata.prefix = token { pattern = "[a-z][a-z0-9\+\.\-]*" }
```

Note This datatype is used to constrain a string of characters to one that can be used as a URI scheme name according to RFC 3986, section 3.1. Thus only the 26 lowercase letters a–z, the 10 digits 0–9, the plus sign, the period, and the hyphen are permitted, and the value must start with a letter.

---

teidata.probability defines the range of attribute values expressing a probability.

Module tei — The TEI Infrastructure

Used by teidata.probCertElement:

- alt/@weights

- certainty/@degree

Content model

```
<content>
 <dataRef name="double">
  <dataFacet name="minInclusive" value="0"/>
  <dataFacet name="maxInclusive" value="1"/>
 </dataRef>
</content>
```

Declaration `teidata.probability = xsd:double`

Note Probability is expressed as a real number between 0 and 1; 0 representing *certainly false* and 1 representing *certainly true*.

---

teidata.probCert defines a range of attribute values which can be expressed either as a numeric probability or as a coded certainty value.

Module tei — The TEI Infrastructure

Used by

Content model

```
<content>
 <alternate>
  <dataRef key="teidata.probability"/>
  <dataRef key="teidata.certainty"/>
 </alternate>
</content>
```

Declaration

```
teidata.probCert = teidata.probability | teidata.certainty
```

---

teidata.replacement defines attribute values which contain a replacement template.

Module tei — The TEI Infrastructure

Used by

Content model `<content> <textNode/></content>`

Declaration `teidata.replacement = text`

---

teidata.sex defines the range of attribute values used to identify the sex of an organism.

Module tei — The TEI Infrastructure

Used by Element:

- actor/@sex
- person/@sex
- personGrp/@sex

- persona/@sex
- sex/@value

Content model

```
<content>
 <dataRef key="teidata.enumerated"/>
</content>
```

Declaration `teidata.sex = teidata.enumerated`

Note Values for attributes using this datatype may be defined locally by a project, or they may refer to an external standard.

---

teidata.temporal.iso defines the range of attribute values expressing a temporal expression such as a date, a time, or a combination of them, that conform to the international standard *Data elements and interchange formats – Information interchange – Representation of dates and times.*

Module tei — The TEI Infrastructure

Used by

Content model

```
<content>
 <alternate>
  <dataRef name="date"/>
  <dataRef name="gYear"/>
  <dataRef name="gMonth"/>
  <dataRef name="gDay"/>
  <dataRef name="gYearMonth"/>
  <dataRef name="gMonthDay"/>
  <dataRef name="time"/>
  <dataRef name="dateTime"/>
  <dataRef name="token"
   restriction="[0-9.,DHMPRSTWYZ/:+\-]+"/>
 </alternate>
</content>
```

Declaration

```
teidata.temporal.iso =
   xsd:date
 | xsd:gYear
 | xsd:gMonth
 | xsd:gDay
 | xsd:gYearMonth
 | xsd:gMonthDay
 | xsd:time
 | xsd:dateTime
 | token { pattern = "[0-9.,DHMPRSTWYZ/:+\-]+" }
```

Note If it is likely that the value used is to be compared with another, then a time zone indicator should always be included, and only the dateTime representation should be used.

For all representations for which ISO 8601:2004 describes both a *basic* and an *extended* format, these Guidelines recommend use of the extended format.

teidata.temporal.w3c defines the range of attribute values expressing a temporal expression such as a date, a time, or a combination of them, that conform to the W3C XML Schema Part 2: Datatypes Second Edition specification.

Module tei — The TEI Infrastructure

Used by Element:

- when/@absolute

Content model

```
<content>
 <alternate>
  <dataRef name="date"/>
  <dataRef name="gYear"/>
  <dataRef name="gMonth"/>
  <dataRef name="gDay"/>
  <dataRef name="gYearMonth"/>
  <dataRef name="gMonthDay"/>
  <dataRef name="time"/>
  <dataRef name="dateTime"/>
 </alternate>
</content>
```

Declaration

```
teidata.temporal.w3c =
   xsd:date
 | xsd:gYear
 | xsd:gMonth
 | xsd:gDay
 | xsd:gYearMonth
 | xsd:gMonthDay
 | xsd:time
 | xsd:dateTime
```

Note If it is likely that the value used is to be compared with another, then a time zone indicator should always be included, and only the dateTime representation should be used.

teidata.temporal.working defines the range of values, conforming to the W3C XML Schema Part 2: Datatypes Second Edition specification, expressing a date or a date and a time within the working life of the document.

Module tei — The TEI Infrastructure

Used by

Content model

```
<content>
 <alternate>
  <dataRef name="date"
   restriction="(19[789][0-9]|[2-9][0-9]{3}).*"/>
  <dataRef name="dateTime"
   restriction="(19[789][0-9]|[2-9][0-9]{3}).*"/>
 </alternate>
```

```
</content>
```

Declaration

```
teidata.temporal.working =
   xsd:date { pattern = "(19[789][0-9]|[2-9][0-9]{3}).*" }
 | xsd:dateTime { pattern = "(19[789][0-9]|[2-9][0-9]{3}).*" }
```

Note If it is likely that the value used is to be compared with another, then a time zone indicator should always be included, and only the dateTime representation should be used.

The earliest time expressable with this datatype is 01 January 1970 (the Unix Epoch), which could be written as either 1970-01-01 or 1970-01-01T00:00:00Z.

---

teidata.text defines the range of attribute values used to express some kind of identifying string as a single sequence of Unicode characters possibly including whitespace.

Module tei — The TEI Infrastructure

Used by Element:

- distinct/@time
- distinct/@space
- distinct/@social
- refState/@delim
- rendition/@selector
- unicodeProp/@value
- valItem/@ident

Content model `<content> <dataRef name="string"/></content>`

Declaration `teidata.text = string`

Note Attributes using this datatype must contain a single 'token' in which whitespace and other punctuation characters are permitted.

---

teidata.truthValue defines the range of attribute values used to express a truth value.

Module tei — The TEI Infrastructure

Used by Element:

- binary/@value
- content/@autoPrefix
- fDecl/@optional
- listChange/@ordered
- metSym/@terminal
- model/@useSourceRendition
- modelGrp/@useSourceRendition
- modelSequence/@useSourceRendition
- numeric/@trunc
- pc/@pre

- sequence/@preserveOrder
- surface/@flipping
- tagsDecl/@partial

Content model `<content> <dataRef name="boolean"/></content>`

Declaration `teidata.truthValue = xsd:boolean`

Note The possible values of this datatype are 1 or true, or 0 or false.

This datatype applies only for cases where uncertainty is inappropriate; if the attribute concerned may have a value other than true or false, e.g. unknown, or inapplicable, it should have the extended version of this datatype: `teidata.xTruthValue`.

---

teidata.unboundedCount defines the range of values used for a counting number or the string unbounded for infinity.

Module tei — The TEI Infrastructure

Used by Element:

- datatype/@maxOccurs

Content model

```
<content>
 <alternate>
  <dataRef name="nonNegativeInteger"/>
  <valList type="closed">
   <valItem ident="unbounded"/>
  </valList>
 </alternate>
</content>
```

Declaration

```
teidata.unboundedCount = xsd:nonNegativeInteger | ( "unbounded" )
```

---

teidata.version defines the range of attribute values which may be used to specify a TEI or Unicode version number.

Module tei — The TEI Infrastructure

Used by Element:

- TEI/@version
- teiCorpus/@version

Content model

```
<content>
 <dataRef name="token"
  restriction="[\d]+(\.[\d]+){0,2}"/>
</content>
```

Declaration

```
teidata.version = token { pattern = "[\d]+(\.[\d]+){0,2}" }
```

Note The value of this attribute follows the pattern specified by the Unicode consortium for its version number (`https://unicode.org/versions/`). A version number contains digits and fullstop characters only. The first number supplied identifies the major version number. A second and third number, for minor and sub-minor version numbers, may also be supplied.

---

teidata.versionNumber defines the range of attribute values used for version numbers.

Module tei — The TEI Infrastructure

Used by Element:

- application/@version
- transcriptionDesc/@version

Content model

```
<content>
 <dataRef name="token"
  restriction="[\d]+[a-z]*[\d]*(\.[\d]+[a-z]*[\d]*){0,3}"/>
</content>
```

Declaration

```
teidata.versionNumber =
   token { pattern = "[\d]+[a-z]*[\d]*(\.[\d]+[a-z]*[\d]*){0,3}" }
```

---

teidata.word defines the range of attribute values expressed as a single word or token.

Module tei — The TEI Infrastructure

Used by teidata.enumeratedElement:

- app/@loc
- binaryObject/@encoding
- certainty/@assertedValue
- code/@lang
- dataFacet/@name
- langKnown/@level
- locus/@from
- locus/@to
- m/@baseForm
- media/@mimeType
- metSym/@value
- metamark/@function
- personGrp/@size
- rhyme/@label
- surplus/@reason
- symbol/@value
- unihanProp/@value

- vLabel/@name

Content model

```
<content>
 <dataRef name="token"
  restriction="[^\p{C}\p{Z}]+"/>
</content>
```

Declaration `teidata.word = token { pattern = "[^\p{C}\p{Z}]+" }`

Note Attributes using this datatype must contain a single 'word' which contains only letters, digits, punctuation characters, or symbols: thus it cannot include whitespace.

---

teidata.xmlName defines attribute values which contain an XML name.

Module tei — The TEI Infrastructure

Used by Element:

- classRef/@key
- classRef/@include
- classRef/@except
- dataRef/@key
- dataRef/@name
- elementRef/@key
- elementSpec/@prefix
- macroRef/@key
- moduleRef/@prefix
- moduleRef/@include
- moduleRef/@except
- moduleRef/@key
- schemaRef/@key
- schemaSpec/@prefix
- unicodeProp/@name
- unihanProp/@name

Content model `<content> <dataRef name="NCName"/></content>`

Declaration `teidata.xmlName = xsd:NCName`

Note The rules defining an XML name form a part of the XML Specification.

---

teidata.xpath defines attribute values which contain an XPath expression.

Module tei — The TEI Infrastructure

Used by Element:

- citeStructure/@match
- modelSequence/@predicate
- param/@value

Content model `<content> <textNode/></content>`

Declaration `teidata.xpath = text`

Note Any XPath expression using the syntax defined in **?**.

When writing programs that evaluate XPath expressions, programmers should be mindful of the possibility of malicious code injection attacks. For further information about XPath injection attacks, see the article at OWASP.

---

teidata.xTruthValue (extended truth value) defines the range of attribute values used to express a truth value which may be unknown.

Module tei — The TEI Infrastructure

Used by Element:

- binding/@contemporary
- iNode/@ord
- kinesic/@iterated
- root/@ord
- said/@aloud
- said/@direct
- seal/@contemporary
- sound/@discrete
- vocal/@iterated
- writing/@gradual

Content model

```
<content>
 <alternate>
  <dataRef name="boolean"/>
  <valList>
   <valItem ident="unknown"/>
   <valItem ident="inapplicable"/>
  </valList>
 </alternate>
</content>
```

Declaration

```
teidata.xTruthValue = xsd:boolean | ( "unknown" | "inapplicable" )
```

Note In cases where where uncertainty is inappropriate, use the datatype `teidata.TruthValue`.

F.3 Reading List

The following lists of readings in markup theory and the TEI derive from work originally prepared by Susan Schreibman and Kevin Hawkins for the TEI Education Special Interest Group, recoded in TEI P5 by Sabine Krott and Eva Radermacher. They should be regarded only as a snapshot of work in progress, to which further contributions and corrections are welcomed (see further http://www.tei-c.org/Support/Learn/tei_bibliography.xml).

Theory of Markup and XML

G Deprecations

This appendix provides a partial list of items (elements, attributes, attribute values, datatypes etc.) which are deprecated in this revision of the TEI Guidelines (revision 113e933e2 of TEI P5 Version 4.12.0).

G.1 Items Scheduled to be Removed

- The *key* attribute is preferred over *name*, as the attribute being referred to is referenced by its *ident*, not its name (which might be different). will be removed on 2026-11-13.
- Because an <entry> can now occur inside an <entry>, the <superEntry> element is no longer needed. For instances where the <superEntry> element was used to group multiple <entry> elements, these Guidelines recommend using instead an outer <entry> element, perhaps with a *type* attribute. will be removed on 2027-03-07.
- The *preserveOrder* on <sequence> has been deprecated. The <interleave> element should be used to denote unordered constructs. will be removed on 2027-05-06.
- In order to properly allow customization of remarks, a <remarks> element must be identifiable; thus it needs to have an @ident attribute. will be removed on 2027-06-01.
- will be removed on 2027-09-01.

G.2 Item Scheduled to become Required

- The *ident* attribute of the <remarks> element will be required after 2027-06-01.

H Prefatory Notes

This Appendix contains (in reverse chronological order) the 'Introductory Notes' prefixed to each revision of the TEI Guidelines since its first publication in 1994.

H.1 Prefatory Note (November 2007)

This publication constitutes the fifth distinct version of the *Guidelines for Electronic Text Encoding and Interchange*, and the first complete revision since the appearance of P3 in 1994. It includes substantial amounts of new material and a major revision of the underlying technical infrastructure. With this version, these Guidelines enter a new stage in their development as a community-maintained open source project. This edition is the first version to have benefitted from the close overview and oversight of an elected TEI Technical Council. The editors are therefore particularly pleased to acknowledge with gratitude the hard work and dedication put into this project by the Council over the last five years.

The Chair of the TEI Board sits on the Technical Council, and the Board appoints the Chair of the Technical Council and one other member of the Council. Other Council members are all elected by the Consortium membership, and serve periods of up to two years at a time. *[Note: What followed was a list of TEI Board and Council members, which was periodically updated over the years, and remains in place with the 2025 Introductory Note.]*

H.2 Prefatory Note (March 2002)

The primary goal of this revision has been to make available a new and corrected version of the TEI Guidelines which:

- is expressed in XML and conforms to a TEI-conformant XML DTD;
- generates a set of DTD fragments that can be combined together to form either SGML or XML document type definitions;
- corrects blatant errors, typographical mishaps, and other egregious editorial oversights;
- can be processed and maintained using readily available XML tools instead of the special-purpose ad hoc software originally used for TEI P3.

A second major design goal of this revision has been to ensure that the DTD fragments generated would not break existing documents: in other words, that any document conforming to the original TEI P3 SGML DTD would also conform to the new XML version of it. Although full backwards compatibility cannot be guaranteed, we believe our implementation is consistent with that goal.

In most respects, the TEI Guidelines have stood the test of time remarkably well. The present edition makes no substantial attempt to rewrite those few parts of them which have now been rendered obsolete by changes since their first publication, though an indication is given in the text of where such rewriting is now considered necessary. Neither does the present version attempt to address any of the many possible new areas of digital activity in which the TEI approach to standardization may have something to offer. Both these tasks require the existence of an informed and active TEI Council to direct and validate such extension and maintenance work, in response to the changing needs and priorities of the TEI user community.

Two exceptions to the above principles may be cited: firstly, the chapter which originally provided a 'Gentle Introduction' to SGML has been completely rewritten to provide a similarly gentle introduction to XML; secondly the chapter on character sets has been completely revised in light of the close connexion between Unicode and XML. The editors gratefully acknowledge the assistance of the *ad hoc* workgroup chaired by Christian Wittern, which undertook to provide expert advice and correction at very short notice, in the latter task.

The preparation of this new version relied extensively on preliminary work carried out by the former North American editor of the TEI Guidelines, C.M. Sperberg-McQueen. In a TEI working paper written in 1999[143] he sketched out a precise blueprint for the conversion of the TEI from SGML to XML, which we have implemented, with only slight modification.

The Editors would also like to express thanks to the team of volunteers from the TEI community who helped us with the task of proofreading the first draft during the summer of 2001; and to Sebastian Rahtz of Oxford University Computing Services, without whose skill and enthusiasm this new edition would not have been possible.

[143] *TEI ED W69*, available from the TEI web site at `http://www.tei-c.org/Vault/ED/edw69.htm`.

A substantial proportion of the work of preparing this new edition was funded with the assistance of a grant from the US National Endowment for the Humanities, whose continued support of the TEI has also been crucial to the effort of setting up the TEI Consortium.

Finally, we would like to thank all our colleagues on the interim management board of the TEI Consortium, in particular its Chairman John Unsworth, for their continued support of the TEI's work, and their willingness to devote effort to the difficult task of overseeing its transition to a new organizational infrastructure.

Summary details of the changes made in the present and previous editions are given in their Prefatory Notes, all of which are now reproduced in an Appendix to the present edition: see *Appendix H Prefatory Notes*.

Lou Burnard and Syd Bauman (TEI Editors)
Oxford and Providence, March 2002.

H.3 Introductory Note (November 2001)

To complete the work started in June of this year, the TEI Editors asked for volunteers from the TEI community to proofread the preliminary XML version. 24 volunteers responded to this call during August, and gave invaluable help both by identifying a number of previously un-noticed errors, and by suggesting areas in which more substantial revision should be undertaken in the future. The Editors gratefully acknowledge the assistance of the following individuals during this exercise:

Jimmy Adair, Syd Bauman, Michael Beddow, Steven Bird, Lisa Charlong, Matthew Driscoll, Patrick Durusau, Tomaz Erjavec, Nick Finke, Tim Finney, Julia Flanders, Mike Fraser, Pankaj Kamthan, François Lachance, Terry Langendoen, Anne Mahoney, Gregory Murphy, Daniel Pitti, Rafal Prinke, Laurent Romary, Stewart Russell, Gary Simons, Elisabeth Solopova, Christian Wittern, Martin Wynne.

In addition to error correction, and clear delineation of those sections in which substantial revision is yet to be undertaken for TEI P5, the present draft differs from earlier ones in the following respects:

- Formal Public Identifiers have been introduced as a means of constructing TEI DTDs and an SGML Open Catalog is now included with the standard release;
- Some systematic errors and omissions in the reference section have been removed; the format of this section has been substantially changed, we hope for the better;
- The chapters on obtaining the TEI DTDs and WSDs have been brought up to date; the chapter on modification has been expanded to include a discussion of the TEI Lite customization;
- All examples and cited markup has been checked for XML validity against the published DTDs, and corrected where faulty; examples have been formatted in a (more or less) consistent style.

Lou Burnard and Syd Bauman (Editors)
Oxford and Providence, November 2001.

H.4 Introductory Note (June 2001)

This is a preliminary version of a revised and fully XML-compliant edition of the TEI Guidelines. Although work on revising and correcting the text of the document is incomplete, by making available this preliminary version we hope to facilitate testing of the XML document type declarations which it describes by as wide a range of TEI users as possible.

The primary goal of this revision is to make available the corrected (May 1999) edition of the Guidelines in a new version which:

- is expressed in XML and itself conforms to a TEI-conformant XML DTD;
- generates a set of XML DTD fragments that can be combined together in the same way as the existing TEI (P3) SGML DTD fragments to form true TEI XML DTD fragments without loss of functionality;
- can be processed and maintained using readily available XML tools instead of the special-purpose ad hoc software originally used for TEI P3.

As noted elsewhere, a number of errors were corrected in the May 1999 edition. A (much) smaller number of errors have also been corrected in this edition, but no new material has been added. We expect the expansion

and modification of the Guidelines to become a real possibility in the context of the newly formed TEI Consortium, which has funded the preparation of this present edition.

A major design goal of both this and the previous revision has been to ensure that the DTD fragments generated would not break existing documents: in other words, that any document conforming to the original TEI P3 SGML DTD would also conform to the new XML version of it. Although full backwards compatibility cannot be guaranteed, we believe our implementation is consistent with that goal.

In making this new version, we relied extensively on preliminary work carried out by the outgoing North American editor of the TEI Guidelines, Michael Sperberg-McQueen. In a TEI working paper written in 1999, TEI ED W69, Michael sketched out a precise blueprint for the conversion of the TEI from SGML to XML, which we have implemented, with only slight modification. The current TEI editors wish to express here our admiration for the detailed care put into that paper, without which our task would have been forbiddingly difficult, if not impossible. We would also like to express our thanks to Sebastian Rahtz of Oxford University Computing Services, for his invaluable assistance in preparing this new edition.

We list here in summary form all the changes made in the present edition. Full technical details are provided in documents TEI EDW69 and TEI EDW70, available from the TEI web site.

1. A new keyword `TEI.XML` has been added. By setting its value to INCLUDE, rather than the default IGNORE, the user can request generation of an XML rather than an SGML DTD;
2. The content models of all elements have been checked, and, where necessary, changed so that they are equally valid as SGML or as XML;
3. The declared value for all attributes has been changed to a form which is equally valid as SGML or as XML;
4. All the examples have been checked for conformance and converted to use XML syntax, where possible. (This process is currently incomplete.)
5. Some errors and duplications in the class membership of elements from the names and dates tagsets have been corrected.

To implement the first of these, we have parameterized the *tag omissibility* indicators '- o' and '- -' used within element declarations in the DTD. When XML is to be generated, the parameter entities concerned are redeclared with the null string as their value.

The second change was achieved by removing SGML-specific features (ampersand connectors, inclusion and exclusion exceptions, various types of attribute content) from the DTD and revising the syntax of the DTD to conform to XML requirements (specifically in the representation of mixed-content models, and by removing redundant parentheses). In making these changes, we took care to ensure that the resulting content model would continue to accept existing valid documents, though in the nature of things it could not be guaranteed to reject the same set of documents. As further discussed in EDW69 and EDW70, some constraints (exclusion exceptions, for example) which could be carried out by a generic SGML parser using TEI P3 will have to be implemented by a special purpose TEI validator using TEI P4.

Much work remains to be done, firstly in testing the new DTD fragments against as wide a range of TEI materials as possible, secondly in revising the discussion of markup theory and practice within the text to reflect current thinking. A few sections of the current text (the Gentle Introduction to SGML and the discussion of Extended Pointer syntax are two examples) will need substantial rewriting. For the most part, however, we think the Guidelines have stood the test of time well and can be recommended to a new generation of text encoders scarcely born at the time they were first formulated.

Lou Burnard and Steve De Rose (Editors)
Oxford and Providence, May 2001.

H.5 Introductory Note (May 1999)

No work of the size and complexity of the TEI *Guidelines* could reasonably be expected to be error-free on publication, nor to remain long uncorrected. It has however taken rather longer than might have been anticipated to complete production of the present corrected reprint of the first edition, for which we present our apologies, both to the many individuals and institutions whose enthusiastic adoption and promotion of the TEI encoding scheme have ensured its continued survival in the rapidly changing world of digital scholarship, and also to the many helpfully critical users whose assiduous uncovering and reporting of our errors have made possible the present revision.

At its first meeting in Bergen, in June 1996, the TEI Technical Review Committee (TRC) approved the setting up of a small working committee to oversee the production of a revised edition of the TEI *Guidelines*, to include corrections of as many as possible of the 'corrigible errors' notified to the editors since publication of the first edition in May 1994, the bulk of which are summarized in a TEI working paper (TEI EDW67, available from the TEI web site).

During the spring of 1997, this TRC Core Subcommittee reviewed nearly 200 comments and proposals which the editors had collected from public debate and discussion over the preceding two years, and provided invaluable technical guidance in disposition of them. We are glad to take this opportunity of expressing our thanks to this subcommittee, whose members were Elli Mylonas, Dominic Dunlop, and David T. Barnard.

The work of making the corrections and regenerating the text proceeded rather fitfully during 1998 and 1999, largely because of increasing demands on the editors' time from their other responsibilities. With the establishment of the new TEI Consortium, it is be hoped that maintenance of the Guidelines will be placed on a more secure footing. Some specific areas in which we anticipate future revisions being carried out are listed below.

Typographic Corrections Made

- examples of TEI markup throughout the text were all checked against the relevant DTD fragment and an embarassingly large number of tagging errors corrected;
- various minor typographic and spelling errors were corrected;
- the 'corrigible errors' listed in working paper TEI EDW67 were all corrected: some of these required specific changes to the DTD which are listed in the next section.

Specific Changes in the DTD

A major goal of this revision was to avoid changes which might invalidate existing data, even where existing constructs seemed erroneous in retrospect. To that end, wherever changes have been made in content models for existing elements, they have as far as possible been made so that the DTD will now accept a superset of what was previously legal. Only one new element (<ab>) has been added.

Where possible, a few content models have been changed in such a way as to facilitate conversion to XML, but XML compatibility is *not* a goal of this revision.

Brief details of all changes made in the DTD follow:

- Several changes were made in class membership, in order to correct unreachability problems. Specifically:
  - elements <geogName>, <persName>, <placeName> were added to the `m.data` class;
  - <geogName> and <placeName> were removed from the `m.placepart` class;
  - the elements <addSpan>, <delSpan>, <gap>, were added to the `m.Edit` class;
  - a new class `m.editIncl` was defined, with members <addSpan>, <delSpan>, and <gap>; this class was then added to the global inclusion class `m.globIncl` along with <anchor> (erroneously a member of the `m.Seg` class, from which it is now removed), `m.metadata` and `m.refsys`;
- added <name> element to `m.addrPart` class;
- added <dateline> to `m.divtop` and `m.divbot` classes;
- added <epilogue> and <castList> to `m.dramafront` class;
- added <divGen> to `m.front` class;
- added <dateline> to `m.divtop` and `m.divtop` classes;
- added <u> element to `a.declaring` class;
- defined new class `m.fmchunk` (front matter chunk), comprising <argument>, <byline>, <docAuthor>, <docDate>, <docEdition>, <docImprint>, <docTitle>, <epigraph>, <head>, and <titlePart> for use in simplification of the content model for <front> element;
- defined new element <ab> (anonymous block), and added it to the `m.chunk` class;
- corrected an error whereby global attributes were not properly defined for elements specifying a non-default value for any of the `a.global` attributes: elements affected include: <foreign>, <hi>, <del>, <pb>, <lb>, <cb>, <language>, <anchor>, and <when>;
- changed content models to permit empty <list> and empty <availability> elements;

- changed content model for <series> element to permit #PCDATA;
- changed content model for <setting> element to permit <date> element as a direct child;
- added a *key* attribute to the `<distance>` element, for consistency with other elements in its class;
- changed content model for <orgName> element to make it more consistent with e.g. <persName>;
- changed content model for <opener> element to include <argument>, <byline>, and <epigraph>;
- changed content models for <app>, <rdgGrp>, and <wit> elements;
- revised attributes on `<hand>` element.

A number of content models were changed with a view to easing the creation of an XML compatible version of the Guidelines. Specifically:

- removed ampersand connectors from <cit>, <respStmt>, <publicationStmt>, and <graph>;
- changed the mixed content models for <sense>, `<re>`, <persName>, <placeName>, <geogName>, `<dateStruct>`, `<timeStruct>`, and <dateline> to make them XML-conformant.

Outstanding Errors

A small number of other known problems remain uncorrected in this version and are briefly listed below. Please watch the TEI mailing list for announcements of their correction.

- elements of class `model.inter` don't always behave as they should (e.g. one cannot insert a <table> before anything else in a);
- some mixed-content problems consequent on the definition of `macro.specialPara` need to be addressed systematically; in particular, the treatment of list items or notes which contain several paragraphs continues to surprise many users: no whitespace is allowed between the paragraphs;
- the *resp* attributes on editorial elements are not consistently defined;
- the discussions of DTD invocation, and the DTD itself, all use system identifiers instead of formal public identifiers.

Our next priority however will be the production of a fully XML-compliant version of the TEI DTD, work on which is already well advanced.

C.M. Sperberg-McQueen and Lou Burnard, May 1999

H.6 Preface (April 1994)

These Guidelines are the result of over five years' effort by members of the research and academic community within the framework of an international cooperative project called the Text Encoding Initiative (TEI), established in 1987 under the joint sponsorship of the Association for Computers and the Humanities, the Association for Computational Linguistics, and the Association for Literary and Linguistic Computing.

The impetus for the project came from the humanities computing community, which sought a common encoding scheme for complex textual structures in order to reduce the diversity of existing encoding practices, simplify processing by machine, and encourage the sharing of electronic texts. It soon became apparent that a sufficiently flexible scheme could provide solutions for text encoding problems generally. The scope of the TEI was therefore broadened to meet the varied encoding requirements of any discipline or application. Thus, the TEI became the only systematized attempt to develop a fully general text encoding model and set of encoding conventions based upon it, suitable for processing and analysis of any type of text, in any language, and intended to serve the increasing range of existing (and potential) applications and use.

What is published here is a major milestone in this effort. It provides a single, coherent framework for all kinds of text encoding which is hardware-, software- and application-independent. Within this framework, it specifies encoding conventions for a number of key text types and features. The ongoing work of the TEI is to extend the scheme presented here to cover additional text types and features, as well as to continue to refine its encoding recommendations on the basis of extensive experience with their actual application and use.

We therefore offer these Guidelines to the user community for use in the same spirit of active collaboration and cooperation with which they have so far been developed. The TEI is committed to actively supporting the widespread and large-scale use of the Guidelines which, with the publication of this volume, is now for the first time

possible. In addition, we anticipate that users of the TEI Guidelines will in some instances adapt and extend them as necessary to suit particular needs; we invite such users to engage in the further development of these Guidelines by working with us as they do so.

Like any standard which is actually used, these Guidelines do not represent a static finished work, but rather one which will evolve over time with the active involvement of its community of users. We invite and encourage the participation of the user community in this process, in order to ensure that the TEI Guidelines become and remain useful in all sorts of work with machine-readable texts.

This document was made possible in part by financial support from the U.S. National Endowment for the Humanities, an independent federal agency; Directorate General XIII of the Commission of the European Communities; the Andrew W. Mellon Foundation; and the Social Science and Humanities Research Council of Canada. Direct and indirect support has also been received from the University of Illinois at Chicago, the Oxford University Computing Services, the University of Arizona, the University of Oslo and Queen's University (Kingston, Ont.), Bellcore (Bell Communications Research), the Istituto di Linguistica Computazionale (C.N.R.) Pisa, the British Academy, and Ohio State University, as well as the employers and host institutions of the members of the TEI working committees and work groups listed in the acknowledgments.

The production of this document has been greatly facilitated by the willingness of many software vendors to provide us with evaluation versions of their products. Most parts of this text have been processed at some time by almost every currently available SGML-aware software system. In particular, we gratefully acknowledge the assistance of the following vendors:

- Berger-Levrault AIS s.a. (for Balise);
- E2S n.v. (for E2S Advanced SGML Editor);
- Electronic Book Technology (for DynaText);
- SEMA Group and Yard Software (for Mark-It and Write-It);
- Software Exoterica (for CheckMark and Xtran);
- SoftQuad, Inc., (for Author/Editor and RulesBuilder);
- Xerox Corporation (for Ventura Publisher).

Details of the software actually used to produce the current document are given in the colophon at the end of the work.

H.7 Acknowledgments

Many people have given of their time, energy, expertise, and support in the creation of this document; it is unfortunately not possible to thank them all adequately. Below are listed those who have served as formal members of the TEI's Work Groups and Working Committees during its six-year history; others not so officially enfranchised also contributed much to the quality of the result.

The editors take this opportunity to acknowledge our debt to those who have patiently endured and corrected our misunderstandings of their work; we hope that they will feel the wait has not been in vain. For any errors and inconsistencies remaining, we must accept responsibility; any virtue in what is here presented, we gladly ascribe to the energies of the keen intellects listed below.

C. M. Sperberg-McQueen and Lou Burnard

TEI Working Committees (1990-1993)

Not all members listed were able to serve throughout the development of the Guidelines.

Committee on Text Documentation: Chair: Dominik Wujastyk (Wellcome Institute for the History of Medicine)

Members 1990–1992: J. D. Byrum (Library of Congress); Marianne Gaunt (Rutgers University); Richard Giordano (Manchester University); Barbara Ann Kipfer (Independent Consultant); Hans Jørgen Marker (Danish Data Archive, Odense); Marcia Taylor (University of Essex);

Committee on Text Representation Chair: Stig Johansson (University of Oslo)

Members 1990–1992: Roberto Cencioni (Commission of the European Communities); David R. Chesnutt (University of South Carolina); Robin C. Cover (Dallas Theological Seminary); Steven J. DeRose (Electronic Book Technology Inc); David G. Durand (Boston University); Susan M. Hockey (Oxford University Computing

Service); Claus Huitfeldt (University of Bergen); Francisco Marcos-Marin (University Madrid); Elli Mylonas (Harvard University); Wilhelm Ott (University of Tübingen); Allen H. Renear (Brown University); Manfred Thaller (Max-Planck-Institut für Geschichte, Göttingen)

Committee on Text Analysis and Interpretation Chair: D. Terence Langendoen (University of Arizona)

Members 1990–1992: Robert Amsler (Bell Communications Research); Stephen Anderson (Johns Hopkins University); Branimir Boguraev (IBM T. J. Watson Research Center); Nicoletta Calzolari (University of Pisa); Robert Ingria (Bolt Beranek Newman Inc); Winfried Lenders (University of Bonn); Mitch Marcus (University of Pennsylvania); Nelleke Oostdijk (University of Nijmegen); William Poser (Stanford University); Beatrice Santorini (University of Pennsylvania); Gary Simons (Summer Institute of Linguistics); Antonio Zampolli, University of Pisa.

Committee on Metalanguage and Syntax Chair: David T. Barnard (Queen's University)

Members 1990–1994: David G. Durand (Boston University); Jean-Pierre Gaspart (Associated Consultants and Software Engineers sa/nv); Nancy M. Ide (Vassar College); Lynne A. Price (Software Exoterica / Xerox PARC); Frank Tompa (University of Waterloo); Giovanni Battista Varile (Commission of the European Communities).

In addition, the two TEI editors served ex officio on each committee.

Following publication of the first draft of the TEI Guidelines (P1) in November 1990, a number of specialist work groups were charged with responsibility for drafting revisions and extensions, which, together with material already presented in P1, constitute the basis of the present work.

In addition, many members of the work groups listed below met on three occasions to review the emerging proposals in detail at technical review meetings convened by the TEI Steering Committee. These meetings, held in Myrdal, Norway (November 1991), Chicago (May 1992) and Oxford (May 1993), were largely responsible for the technical content and organization of the present work. Attendants at these meetings are starred in the list below.

TR1 Character sets Chair: Harry Gaylord* (University of Groningen); Syun Tutiya* (Chiba University).

TR2 Text criticism Chair: Peter Robinson* (Oxford University); David Chesnutt* (University of South Carolina); Robin Cover* (Dallas Theological Seminary); Robert Kraft (University of Pennsylvania); Peter Shillingsburg (Mississippi State University).

TR3 Hypertext and hypermedia Chair: Steven J. DeRose* (Electronic Book Technologies Inc); David Durand (Boston University); Edward A. Fox (Virginia State University); Eve Wilson (University of Kent).

TR4 Formulæ, Tables, figures, and graphics Chair: Paul Ellison* (University of Exeter); Anders Berglund (Independent Consultant); Dale Waldt (Thompson Professional Publishing).

TR6 Language corpora Chair: Douglas Biber* (University of Northern Arizona); Jeremy Clear (Birmingham University); Gunnel Engwall (University of Stockholm).

TR9 Manuscripts and codicology Chair: Claus Huitfeldt* (University of Bergen); Dino Buzzetti (University of Bologna); Jacqueline Hamesse (University of Louvain); Mary Keeler (Georgetown University); Christian Kloesel (Indiana University); Allen Renear* (Brown University); Donald Spaeth (Glasgow University).

TR10 Verse Chair: David Robey* (University of Manchester); Elaine Brennan* (Brown University); David Chisholm (University of Arizona); Willard McCarty (University of Toronto).

TR11 Drama and performance texts Chair: Elli Mylonas* (Harvard University); John Lavagnino* (Brandeis University); Rosanne Potter (University of Iowa).

TR12 Literary prose Chair Thomas N. Corns* (University of Wales); Christian Delcourt (University of Liège).

AI1 Linguistic description Chair: D. Terence Langendoen* (University of Arizona); Stephen R. Anderson (Johns Hopkins University); Nicoletta Calzolari (University of Pisa); Geoffrey Sampson* (University of Sussex); Gary Simons* (Summer Institute of Linguistics).

AI2 Spoken text Chair: Stig Johansson* (University of Oslo); Jane Edwards (University of California at Berkeley); Andrew Rosta (University College London).

AI3 Literary studies Chair: Paul Fortier* (University of Manitoba); Christian Delcourt (University of Liège;); Ian Lancashire (University of Toronto); Rosanne Potter (University of Iowa); David Robey* (University of Manchester).

AI4 Historical studies Chair: Daniel Greenstein* (University of Glasgow); Peter Denley (Queen Mary Westfield College, London); Ingo Kropac (University of Graz); Hans Jørgen Marker (Danish Data Archive, Odense); Jan Oldervoll (University of Tromsø); Kevin Schurer (University of Cambridge); Donald Spaeth (Glasgow University); Manfred Thaller (Max-Planck-Institut für Geschichte, Göttingen).[144]

AI5 Print dictionaries Chairs: Robert Amsler* (Bell Communications Research) and Nicoletta Calzolari (University of Pisa); Susan Armstrong-Warwick (University of Geneva); John Fought (University of Pennsylvania); Louise Guthrie (University of New Mexico); Nancy M. Ide* (Vassar College); Frank Tompa (University of Waterloo); Carol Van Ess-Dykema (US Department of Defense); Jean Veronis (University of Aix-en-Provence).

AI6 Machine lexica Chair: Robert Ingria* (Bolt Beranek Newman Inc); Susan Armstrong-Warwick (University of Geneva); Nicoletta Calzolari (University of Pisa).

AI7 Terminological data Chair: Alan Melby* (Brigham Young University) Gerhard Budin (University of Vienna); Gregory Shreve (Kent State University); Richard Strehlow (Oak Ridge National Laboratory); Sue Ellen Wright (Kent State University).

Advisory Board

Members of the TEI Advisory Board during the lifetime of the project are listed below, grouped under the name of the organization represented.

American Anthropological Association: Chad McDaniel (University of Maryland).

American Historical Association: Elizabeth A. R. Brown (Brooklyn College, CUNY).

American Philological Association: Jocelyn Penny Small (Rutgers University).

American Philosophical Association: Allen Renear (Brown University).

American Society for Information Science: Clifford A. Lynch (University of California).

Association for Computing Machinery, Special Interest Group for Information Retrieval: 1989–93: Scott Deerwester (University of Chicago); 1993- : Martha Evens (Illinois Institute of Technology).

Association for Documentary Editing: David Chesnutt (University of South Carolina).

Association for History and Computing: 1989–91: Manfred Thaller, Max-Planck-Institut für Geschichte, Göttingen; 1991- : Daniel Greenstein (Glasgow University).

Association Internationale Bible et Informatique 1989–93: Wilhelm Ott (University of Tübingen); 1993- : Winfried Bader (University of Tübingen).

Canadian Linguistic Association: Anne-Maria di Sciullo (Université du Québec à Montréal)

Dictionary Society of North America: Barbara Ann Kipfer (Independent Consultant).

AAP Electronic Publishing Special Interest Group: 1989–92: Betsy Kiser (OCLC); 1992- : Deborah Bendig and Andrea Keyhani (OCLC).

International Federation of Library Associations and Institutions: J. D. Byrum Jr. (The Library of Congress).

Linguistic Society of America: Stephen Anderson (The Johns Hopkins University)

Modern Language Association: Randall Jones (Brigham Young University) and Ian Lancashire (University of Toronto).

Steering Committee Membership

Members of the Steering Committee of the TEI during the preparation of this work were:

Association for Computational Linguistics:

[144] This Workgroup was jointly sponsored by the Association for History and Computing.

- 1987–1993: Robert A. Amsler (Bell Communications Research);
- 1987–1993: Donald E. Walker (Bell Communications Research);
- 1993–1994: Susan Armstrong-Warwick (University of Geneva);
- 1994–1999: Judith Klavans (Columbia University).

Association for Computers and the Humanities:

- 1987–1999: Nancy M. Ide (Vassar College);
- 1987–1994: C. M. Sperberg-McQueen (University of Illinois at Chicago);
- 1994–1999: David Barnard (Queen's University).

Association for Literary and Linguistic Computing:

- 1987–1999: Susan M. Hockey (Center for Electronic Texts in the Humanities);
- 1987–1999: Antonio Zampolli (University of Pisa).

I Colophon

The text of this manual was prepared electronically on a variety of systems. Most sections were originally drafted by members of the work groups and working committees of the TEI; all have been revised by the editors to achieve greater uniformity of style and greater consistency in the tag set.

The web release of the Guidelines was created using a library of XSLT stylesheets to convert to XHTML; the PDF version for printing was produced by conversion to LaTeX markup, processed using XeLaTeX. The XSLT libraries were written by Sebastian Rahtz.

Almost every available SGML and XML editor or processing program has been used at one time or another by the TEI; but without the open source implementations of XML parsers, editors and XSLT engines by James Clark, Richard Stallman, Michael Kay, and Daniel Veillard, the TEI could not survive, and we thank these individuals. We would also like to thank the staff at SyncRO Soft SRL, creators of the oXygen editor, for their support for the TEI during the creation on P5.

Many volunteers contributed to the preparation of this release of the Guidelines; we particularly note the work of Sabine Krott, Eva Radermacher and Arianna Ciula for their work in structuring the bibliographies.

The production and release process for TEI P5 was originally developed by Sebastian Rahtz for the TEI Technical Council.

Index

Entries in italic font refer to examples, with those in bold italics referring to examples where the indexed element is the root.
